

This histological image shows a comparison between treated and untreated liver tissue. The top half of the image, labeled 'Treated liver', shows a dense field of hepatocytes with many pale, vacuolated cells, indicating significant lipid accumulation (steatosis). The bottom half, labeled 'Untreated liver', shows a more typical liver architecture with more uniform hepatocytes and a clear portal tract on the left containing a bile duct and blood vessels. The overall staining is purple (hematoxylin) and pink (eosin).

Treated liver

Untreated
