Dear Dr. Myers:

We thank you for the invitation to submit our work to the Journal of Visualized Experiments. Please find attached a manuscript for consideration of publication titled *A Methodology to Characterize the Sense of Agency over the Actions of Neural-Machine-Interface Operated Prostheses*.

The attached manuscript describes a methodology to explicitly and implicitly characterize the formation of agency during the operation of prostheses controlled via neural-machine interfaces. Agency, the experience of authorship of our actions, is fundamental to how we perceive and control our limbs. By striving to incorporate advanced upper-limb prostheses into this same perceptual framework, we can begin to more closely integrate the user and their artificial limb. Our protocol requires participants to control and receive feedback from a virtual prosthetic hand using their pre-existing NMI systems. A virtual grasping task is performed and two separate measures of agency are employed: established psychophysical questionnaires (to capture the explicit sense of agency) and a time interval estimate task to capture the implicit sense of agency (intentional binding). The results of this protocol may help us understand how to provide prosthetic users with an intrinsic sense of control over their device, and may serve as a platform for assessment and tuning of a device to ultimately improve prosthetic control.

We thank you for your consideration and look forward to working with you to communicate our work to the wider research community.

Yours sincerely,

A handwritten signature in blue ink, appearing to read "P. Marasco", with a long horizontal flourish extending to the right.

Paul D. Marasco, Ph.D.

SUMMARY:

Here we present a protocol which characterizes the sense of agency developed over the control
of sensate virtual or robotic prosthetic hands. Psychophysical questionnaires are employed to
capture the explicit experience of agency, and time interval estimates (intentional binding) are
employed to implicitly measure the sense of agency.

ABSTRACT:

This work describes a methodological framework that can be used to explicitly and implicitly
characterize the sense of agency developed over the neural-machine interface (NMI) control of
sensate virtual or robotic prosthetic hands. The formation of agency is fundamental in
distinguishing the actions that we perform with our limbs as being our own. By striving to
incorporate advanced upper-limb prostheses into these same perceptual mechanisms, we can
begin to integrate more closely an artificial limb into the user's existing cognitive framework for
limb control. This has important implications in promoting user acceptance, use, and effective

control of advanced upper-limb prostheses. In this protocol, participants control a virtual prosthetic hand and receive kinesthetic sensory feedback through their preexisting NMIs. A series of virtual grasping tasks are performed and perturbations are systematically introduced to the kinesthetic feedback and virtual hand movements. Two separate measures of agency are employed: established psychophysical questionnaires (to capture the explicit experience of agency) and a time interval estimate task to capture the implicit sense of agency (intentional binding). Results of this protocol (questionnaire scores and time interval estimates) can be analyzed to quantify the extent of agency formation.

INTRODUCTION:

As robotic prostheses become increasingly advanced, the importance of relevant sensory feedback will continue to grow. Sensory feedback affects how humans perceive, interact with, and even integrate machines into their body schema. Recent NMI techniques can now provide prosthetic limb users with intuitive control and achieve sensations associated with touch¹⁻⁷ and kinesthesia (movement sense)^{8,9} in missing limbs. When this sensory information is paired with the visual information provided by watching the artificial limb during operation, we have access to key elements that inform the distinction of self-*versus*-other. Leveraging this access may help bring prosthetic limb users a step closer to operating an artificial limb as a part of their body, rather than just a tool.

Body awareness and the sense of being embodied arises from the establishment of agency (the experience of authorship over a limb's actions) and ownership (the feeling that a limb is a part of the body)^{10,11}. Ownership is primarily mediated through the integration of touch and visual information¹². Agency emerges from the integration of intent, movement sensation (kinesthesia), visual information, and predictive cognitive models¹¹. During the performance of a voluntary action, agency is formed when the sensory consequences of that action align with the performer's intent and predictions from the performer's internal models¹³. Agency is separate and distinct from ownership. The concept of limb ownership has been studied frequently in prosthesis literature¹⁴. A sense of limb ownership forms in NMI participants when touch feedback is spatially and temporally appropriate, as measured explicitly through questionnaires or implicitly through changes in residual limb temperature, or temporal order judgments¹⁵. However, fewer opportunities have existed to explore agency in the context of NMI¹⁶. Recent work with NMI participants has demonstrated that agency can be purposefully promoted and is separate from the experience of ownership⁸.

Agency is particularly significant in the operation of robotic prostheses as it is a cognitive link to the control of the artificial limb's physical actions through experiences of causality, the feeling of controlling the artificial limb or causing something to happen¹⁷. Robotic prostheses are advanced computerized machines that the user must cooperate with to effectively complete tasks. Some prosthetic limbs have incorporated autonomous functions, such as grip-slip detection and correction; yet these systems have seen limited adoption as functionality running outside the user's control can be viewed as frustrating if not appropriately implemented^{8,18}. This presents a fundamental challenge that is echoed throughout applications of human cooperation with autonomous machines. That is, humans often trust their own actions over those resulting from a

collaboration with computers or machines, and this trust directly influences an operator's likelihood to use the autonomous functions^{19,20}. As humans, we innately trust ourselves and our bodies to perform the actions we intend; when this is achieved, we establish an intrinsic sense of agency. Interestingly, the formation of agency is impacted in cooperative human-computer actions. During human-human cooperative tasks, a shared sense of agency may be formed over movement²¹; yet, the literature suggests that shared agency is encumbered during human-computer cooperation^{22,23}. These challenges are reflected in prosthetic upper-limb use, and the rejection rates of robotic devices remain high, with 23% - 39% of users discontinuing their use²⁴. In fact, many prosthesis users still prefer body-powered systems²⁵. These systems remove the computerized machine from the control loop and more intimately couple the user's body movement to the prosthesis movement *via* wire cables. This further reinforces the importance of cognitive integration in the use of advanced prosthetic devices. We suggest that NMI systems can provide a number of the necessary sensory and motor pieces to help move artificial limbs closer to establishing a cooperative sense of agency, and this will be instrumental in promoting the acceptance and the true integration of these computerized machines with their users.

Agency may be measured in a number of ways. The simplest measures use psychophysical questionnaires or scales that explicitly ask participants to whom or what they attribute an event^{17,26,27}. This relies on an individual's existing perception of "self" by requiring participants to make inferential judgments of self-attribution (*i.e.*, to explicitly judge whether "I" or another entity was responsible for an action or event). Implicit measures provide insight into the background cognitive processes that occur during motor action and sensory events. This view of agency attempts to measure that which is not explicitly perceived by an individual. Typically, this is achieved by having participants characterize a perceived difference in self-generated actions and externally generated ones, for example, having participants report the duration of time they perceived to occur between a self-generated event and an externally generated one^{17,28}. During the performance of self-generated actions, agency implicitly manifests as a perceptual compression in time between actions and their sensory consequences, known as intentional binding²⁸. When individuals report the time they perceived to occur between an action and its outcome, a shorter perceived duration of time corresponds to a more strongly formed sense of agency^{29,30}. Interestingly, it has been demonstrated that explicit and implicit measures may not directly correlate as they are likely characterizing different perceptual mechanisms¹⁷ that together inform the sense of agency. As such, establishing a more comprehensive understanding of agency formation during prosthesis use will likely require experimental protocols employing both explicit and implicit measures.

This work describes a methodological framework that can be used to explicitly and implicitly characterize the sense of agency developed over the NMI control of sensate virtual or robotic prosthetic hands. Two techniques to measure agency during the performance of a sensorimotor object-grasping task are highlighted. Established psychophysical questionnaires are employed to capture the explicit experience of agency, while time interval estimates (intentional binding) are employed to implicitly measure the sense of agency.

The scope of this protocol is to evaluate the sense of agency in the context of an NMI that

provides physiologically relevant active motor control and kinesthetic feedback. These techniques are generalizable to virtual or physical prosthetic NMI systems. There are minimal restrictions on the populations that may be recruited to perform this protocol. For instance, the mobility of the participant's upper limbs cannot be bilaterally affected (they must have one sound limb), and they must possess the cognitive ability to make time-based judgments and articulate experienced sensations.

PROTOCOL:

This protocol has been previously approved and follows the guidelines of the Cleveland Clinic's human research ethics committee.

1. Hardware and Software of the NMI

1.1. Establish each individual participant's NMI control and feedback so that when they attempt to perform a movement, they see and feel a virtual prosthesis complete that movement.

1.1.1. Generate a hand kinesthetic percept through the participant's NMI and capture the kinematics of the perceived motion by having the participant demonstrate what they feel using their intact hand.

NOTE: Techniques to characterize kinesthetic percept kinematics have been illustrated in other works⁸ and may be achieved using a data glove or an optical motion capture system.

1.1.2. Use a virtual hand/prosthetic simulation to reproduce the kinematics of the movement percept.

1.1.3. Set up hardware to capture the intentional hand movement control signals from the participant's NMI.

1.1.4. Map this control signal to the activity of the virtual prosthesis.

1.1.5. Create a master control program that coordinates the acquisition of the NMI control signal, the movement of the virtual prosthesis, and the generation of kinesthetic NMI feedback in real-time.

2. Experimental Setup

2.1. Seat the participant and position a monitor horizontally (*i.e.*, on its back, facing upward) on a table in front of them.

2.2. Display the virtual prosthesis on the monitor and adjust its size and location so that it is positioned congruently with the location of their missing limb.

2.3. Render objects (*e.g.*, floating balls) in the virtual environment to serve as stop points for the

close and open positions of the hand (endpoints of movement).

2.4. Configure the master control program so that when the virtual digits make contact with the virtual stop points, an auditory tone is played after an adjustable time delay (300, 500, 700, or 1,000 ms).

3. Experimental Conditions

3.1. Build an input file for the master control program that specifies the settings for each trial, including the auditory tone delay, whether the NMI feedback is turned on/off, the speed and direction of the virtual hand movement, and the delay between the command and the virtual hand movement.

3.1.1. Create two control conditions, a baseline and a passive condition.

3.1.1.1. For the baseline condition, configure the kinematics and control of the virtual hand to match the NMI kinesthetic percept.

NOTE: The baseline condition represents the ideal congruency of motor intent, movement kinematics, and kinesthetic feedback.

3.1.1.2. Program the passive condition to perform a virtual hand movement when triggered by the investigator (removing the control from the user) while still providing the participant with the NMI kinesthetic percept.

NOTE: The passive condition captures the theoretical worst-case agency conditions (*i.e.*, movement in the absence of control [without intent], similar to one's body being passively moved).

3.1.2. Program additional conditions designed to parse out the contributions to agency of motor intent, kinesthetic sensation, and temporal mismatch with the displayed kinematics of the virtual prosthesis. Consider using the following five conditions.

3.1.2.1. Opposite movement: the NMI kinesthetic feedback indicates that the hand closes while the hand visualization opens.

3.1.2.2. Too fast: the hand visualization closes faster than indicated by the NMI kinesthetic feedback.

3.1.2.3. Too slow: the hand visualization closes slower than indicated by the NMI kinesthetic feedback.

3.1.2.4. Onset delay: the hand visualization closes 1 s later than indicated by the NMI kinesthetic feedback.

3.1.2.5. No feedback: the hand visualization closes without any NMI kinesthetic feedback.

4. Performance of the Experiment

4.1. Instruct participants to drive the hand from the open to the closed position without stopping and to report their estimation of the time delay from when the virtual digits contacted the virtual stop points to when they heard the auditory tone.

NOTE: Participants may use any representation of time between 0 and 1 s that makes the most sense to them (*e.g.*, milliseconds, fractions of seconds, a 0 - 10 scale).

4.2. Initiate each trial by pressing a start button on the master control program, which moves the virtual hand to the start position, signaling the beginning of the trial. This cues the participant to drive the virtual hand to the virtual stop points, which causes an auditory tone to play after a randomized delay (300, 500, or 700 ms).

4.2.1. Record the participant's verbally reported estimation of the time delay interval.

4.3. Organize trials into experimental blocks.

4.3.1. Begin with two practice sessions and exclude them from the final analysis.

4.3.1.1. In the first practice session, have the participant drive the hand to the movement endpoint and play the auditory tone 1,000 ms after the virtual digits reach the virtual stop points for 10 trials.

4.3.1.1.1. Participants do not need to report the estimated intervals for this practice session.

NOTE: This step is necessary to orient the participants to how long a single second feels.

4.3.1.2. In the second practice session, again, have the participant drive the hand to the movement endpoint. Randomize the auditory tones so that the 300, 500, and 700 ms delay intervals are presented at least 5x each.

4.3.1.2.1. Ask participants to report the estimated delay intervals.

4.3.1.2.2. Do not inform the participant of how close their estimates of the delay intervals are to the actual delay during these practice trials or subsequent trials in the experimental block.

NOTE: This step is important as participants will likely be inexperienced in making time judgments on a scale of fractions of a second, and the testing procedure may not be intuitive to the unpracticed test participant.

4.3.2. Move to experimental sets of 15 trials for each condition. Present the conditions in a randomized order and administer a questionnaire at the end of each condition.

4.3.2.1. Instruct the participants to reflect upon the latest set of trials and complete the eight-statement agency questionnaire (includes four questions to quantify the explicit experience of agency and four control questions [example provided in the **Supplementary File**])^{8,26}.

4.3.2.1.1. Randomize the questionnaire statements to provide at least five unique question orders to be randomly presented to the participants.

4.3.3. End the experimental block with a set of 15 trials for the passive condition and administer a questionnaire after completing these trials.

NOTE: Administer the passive trials at the end of each experimental block to avoid interfering with an established sense of agency.

4.4. Complete four experimental blocks with different randomized orders of experimental conditions.

4.5. Provide multiple opportunities over the duration of testing for the participants to take a break. There is no minimum time or time limit for these breaks, but ensure the participant is not physically or mentally fatigued prior to continuing the testing.

REPRESENTATIVE RESULTS:

The experimental protocol was performed with three amputee participants operating a sensate virtual prosthesis *via* their NMI⁸ (**Figure 1**). The setup used a participant-controllable virtual hand moving through preprogrammed kinematic profiles using the MuJoCo HAPTIX physics engine³¹. The virtual hand was displayed on a horizontal monitor in front of the participants at a location spatially congruent with their missing limb. The NMI participants had previously undergone a surgical neural rewiring procedure (targeted reinnervation), which was coupled with standard prosthetic limb myoelectric (EMG) control strategies to provide intuitive control of the virtual hand³²; thus, the participants could drive the virtual hand by ‘thinking’ about opening and closing their missing hand. Strategic vibrations of the participants’ surgically rewired muscles induced illusory perceptions of hand movement, providing a platform for kinesthetic sensory feedback⁸. Through custom software, EMG hand control signals and virtual prosthesis renderings were integrated with the output of a vibration feedback device. When the participant initiated a movement of the displayed virtual hand, the vibration would induce a corresponding matched sensation of a complex grip movement in the missing hand.

[Place **Figure 1** here]

Figure 2A is provided for the comparison of explicit measures of agency under each of the feedback conditions. Here, the average score for the four agency questions (and four control questions) are plotted for each participant and by each feedback condition. In **Figure 2B**, these

individual participant scores are averaged and plotted for each feedback condition, with the error bars representing the average standard deviation. An average rating greater than 1 indicates an agreement with a given statement and 0 indicates neutrality of agreement²⁶. Higher agreement ratings (≥ 1) for the agency questions indicate a greater experience of agency. The responses to the control questions should be negative or neutral (≤ 0) and a score between 0 and 1 is taken as inconclusive. The 'baseline', 'too fast', and 'no feedback' condition demonstrated the lowest average interval estimates indicating the strongest sense of agency formed, whereas the 'passive' and 'opposite movement' conditions demonstrated the weakest sense of agency.

[Place **Figure 2** here]

For a comparison of intentional binding in each feedback condition, **Figure 3A** shows the time interval estimates for each participant, averaged according to feedback condition. Differences between the actual and perceived time intervals were then averaged across the three participants and are presented in **Figure 3B** relative to the baseline feedback condition. The error bars denote the average standard deviation. Lower time interval estimates (**Figure 3A**) and larger negative differences (**Figure 3B**) are an indication of a stronger implicit sense of agency. The 'too fast' condition followed by the baseline condition demonstrated the lowest average interval estimates, indicating the strongest sense of agency formed, whereas the 'opposite movement' condition demonstrated the weakest sense of agency.

[Place **Figure 3** here]

Figure 4 allows for a comparison of explicit and implicit agency measures. The average difference between actual and perceived time intervals are plotted relative to the results of the baseline feedback condition and with respect to the averaged agency questionnaire scores for each feedback condition. In this presentation of data, moving from left to right on the x-axis indicates a decrease in the explicit experience of agency and moving from bottom to top on the y-axis indicates a decrease in the implicit sense of agency. As in **Figure 2** and **Figure 3**, the 'too fast' condition demonstrated the strongest formation of agency, both explicitly and implicitly.

[Place **Figure 4** here]

FIGURE AND TABLE LEGENDS:

Figure 1: An example setup that satisfies the requirements to characterize agency. This setup provides the user with intuitive control and kinesthetic feedback of a displayed virtual hand. Virtual hand control and feedback are achieved through the neural-machine interface using myoelectric control and vibration stimulation (eliciting illusory movement percepts of the missing limb) of the amputees' reinnervated musculature. Control and feedback are coordinated through a data acquisition system and computer running custom software. Virtual hand kinematics are displayed to the user on a horizontal monitor.

Figure 2: Explicit measures of agency under each feedback condition. (A) The average score for

the four agency and four control questions provided to each participant under each feedback condition. **(B)** The average scores across participants under each feedback condition. The error bars represent the standard deviation. In both plots, an average rating greater than +1 indicates agreement and, for the agency questions, the formation of agency, while 0 indicates neutrality. This figure has been modified from Marasco *et al.*⁸.

Figure 3: Implicit measures of agency via time interval estimates under each feedback condition. **(A)** The average interval estimates for the delay interval between the completion of the virtual hand close and the auditory tone plotted for each participant across each randomly presented actual interval. The results are plotted for each feedback condition, and a lower time estimate indicates a stronger sense of agency. These panels have been modified from Marasco *et al.*⁸. **(B)** The average difference (across participants and delay intervals) between the actual time delay and the participant's estimated time interval relative to the baseline feedback condition. The results are plotted for both. Here, a more negative value indicates a stronger average sense of agency, and CI denotes 95% confidence interval (CI).

Figure 4: Average explicit and implicit measures of agency for each feedback condition, combining the results presented in Figure 2B and Figure 3B. The average explicit agency results are plotted on the x-axis and the average interval estimates are plotted on the y-axis. The error bars denote standard deviation. Moving from left to right on the x-axis indicates a decrease in the explicit experience of agency, and moving from bottom to top on the y-axis indicates a decrease in the implicit sense of agency. This figure has been modified from Marasco *et al.*⁸.

DISCUSSION:

Here a methodological framework is presented to characterize the experience of agency formed while operating sensate prostheses *via* NMIs. In this context, agency is particularly relevant as it bridges physical action to the background cognitive processes that shape perception. Through a participant's prosthesis and NMI, we have direct access to a number of key elements that establish the sense of agency: intent, motor output, and movement sensation. Of importance to advanced prosthetic limb control, the tools provided in this work leverage this direct access to help unlock an understanding of how these elements may promote the user's sense of control over, and the cognitive integration of, the actions of their prosthesis.

The techniques highlighted are flexible in that they can be employed with any NMI research and clinical prosthetic system so long as they meet the criteria for real-time perceptually relevant control and kinesthetic feedback. The advantage inherent to many NMIs is the potential for intuitive control achieved by leveraging the neural pathways that remain postamputation. This allows for the measurement of residual physiological activity that once accompanied intact limb movement, which can, in turn, be decoded and mapped to the appropriate virtual or prosthetic limb movement. Therefore, most NMI techniques should satisfy the requirement for perceptually relevant control, provided that the recorded neural activity and the accompanying digital interface can produce reliable output signals that can be appropriately mapped to the virtual hand. The experimental setup also requires a system providing investigators with the ability to actively initiate kinesthetic sensations in real-time with the displayed virtual hand kinematics.

This is a critical requirement as a sense of agency over movements is established when we engage in an action and appropriate sensory feedback is returned during the completion of that action¹³. Again, as long as this criterion is met, most any NMI kinesthetic feedback system will be appropriate.

The techniques presented here have the advantage of evaluating both explicit and implicit cognitive-perceptual measures of agency. There is evidence to suggest that each may be a result of separate cognitive mechanisms that, together, form a complete sense of agency¹⁷; however, there is still not a complete understanding of this relationship. The results from these measures are quantitative and easily interpreted. Decreases in time interval estimates suggest that a stronger implicit sense of agency was formed. Similarly, higher questionnaire scores on agency statements indicate a stronger explicit experience of agency. It is suggested that these quantitative values can provide a basis to evaluate and tune NMI control and sensory feedback. For example, in a previous work⁸ that is reported here in **Figure 4**, participants often reported smaller perceived time intervals and explicitly reported stronger perceived agency when a virtual hand was displayed that closed slightly faster than the kinesthetic sensation they experienced. This indicates that the user felt a stronger sense of control over the actions of the hand, as reported explicitly, but also suggests that the cognitive processes that establish this sense of control more strongly associate with this faster kinematic display. As such, an adjustment to the NMI control scheme of a clinical prosthesis to accommodate faster hand closing may help improve the user's perceptions of control over their physical device and encourage the user to identify their device's actions as self-generated.

The techniques presented may also be employed to form a more complete understanding of how multiple sensory modalities may influence perceptions of ownership over artificial limbs. For example, touch sensory feedback (or other sensory modalities) may be incorporated into the paradigm presented here to evaluate their possible individual roles in potentiating the sense of agency. Additionally, the techniques presented here may be paired with measures of ownership to more comprehensively characterize the interrelationships between agency, embodiment, and individual sensory modalities. The methods provided may also have broader applicability beyond NMI-controlled devices. Similar experimental tasks could be implemented with complex control systems (such as myoelectric pattern recognition), traditional myoelectric prostheses, and body-powered systems, as well as systems without NMI sensory feedback. This may allow for a unique perspective in understanding how cognitive processes respond to less 'natural' control and feedback paradigms and provide insights into how agency and perceptions of control may act during the operation of more traditional research or clinical prosthetic systems.

As robotic prostheses grow increasingly sophisticated, so too does the need for effective control and cognitive integration of these devices. Sensation is a pathway to addressing a number of critical barriers, and being able to assess the underpinning mechanisms that process movement sensation and information is an important piece. The tools provided here can help facilitate the integration of devices with users by characterizing the explicit and implicit formation of agency. These techniques help quantify the benefits of the innate access to intuitive motor control and sensation that NMIs may provide and can offer a platform for assessment and tuning, to

ultimately improve the user's perception of being in control of their artificial limb.

Name of Material/ Equipment	Company
LabVIEW 2015, Service Pack 1, Version 15.0.1f2 64-bit 8-Slot, USB CompactDAQ Chassis ± 60 V, 800 kS/s, 12-Bit, 8-Channel C Series Voltage Input Module 100 kS/s/ch Simultaneous, ± 10 V, 4-Channel C Series Voltage Output Module	National Instruments, Austin, TX, USA National Instruments, Austin, TX, USA National Instruments, Austin, TX, USA National Instruments, Austin, TX, USA
Custom Wearable Kinesthetic Tactor	HDT Global, Solon, OH, USA
MuJoCo Physics Engine, HAPTIX Version	Roboti LLC, Redmond, WA, USA
Myobock Electrodes, powered by Otto Bock EnergyPack in MyoBoy Battery Receptacle	Ottobock, Duderstadt, Germany

Catalog Number	Comments/Description
Full or Pro Version cDAQ-9178	We wrote custom software in LabVIEW to coordinate virtual prosthesis control with kinesthetic feedback as well as to present experimental conditions and record data.
NI-9221	
NI-9263	
N/A	This item was custom made. Other methods of delivering kinesthetic feedback are acceptable as long as the participant feels the sensation of the hand moving in real-time with the movements of the virtual hand.
mjhaptix150	Newer versions of MuJoCo should be acceptable as well. We used the MPL Gripper Model.
electrodes: 13E200=60	
battery: 757B21	Any setup that provides an amplified, filtered, and rectified EMG or neural control signal could be used.
battery receptacle: 757Z191=2

ARTICLE AND VIDEO LICENSE AGREEMENT

Title of Article:	A Methodology to Characterize the Sense of Agency over the Actions of Neural-Machine-Interface Operated Prostheses
Author(s):	Jonathon S Schofield, Courtney E Shell, Zachary C Thumser, Dylan T Beckler, Raviraj Nataraj, Paul D Marasco

Item 1: The Author elects to have the Materials be made available (as described at <http://www.jove.com/publish>) via:

☒ Standard Access

☐ Open Access

Item 2: Please select one of the following items:

☐ The Author is **NOT** a United States government employee.

☒ The Author is a United States government employee and the Materials were prepared in the course of his or her duties as a United States government employee.

☐ The Author is a United States government employee but the Materials were NOT prepared in the course of his or her duties as a United States government employee.

ARTICLE AND VIDEO LICENSE AGREEMENT

1. **Defined Terms.** As used in this Article and Video License Agreement, the following terms shall have the following meanings: **"Agreement"** means this Article and Video License Agreement; **"Article"** means the article specified on the last page of this Agreement, including any associated materials such as texts, figures, tables, artwork, abstracts, or summaries contained therein; **"Author"** means the author who is a signatory to this Agreement; **"Collective Work"** means a work, such as a periodical issue, anthology or encyclopedia, in which the Materials in their entirety in unmodified form, along with a number of other contributions, constituting separate and independent works in themselves, are assembled into a collective whole; **"CRC License"** means the Creative Commons Attribution-Non Commercial-No Derivs 3.0 Unported Agreement, the terms and conditions of which can be found at: <http://creativecommons.org/licenses/by-nc-nd/3.0/legalcode>; **"Derivative Work"** means a work based upon the Materials or upon the Materials and other pre-existing works, such as a translation, musical arrangement, dramatization, fictionalization, motion picture version, sound recording, art reproduction, abridgment, condensation, or any other form in which the Materials may be recast, transformed, or adapted; **"Institution"** means the institution, listed on the last page of this Agreement, by which the Author was employed at the time of the creation of the Materials; **"JoVE"** means MyJove Corporation, a Massachusetts corporation and the publisher of The Journal of Visualized Experiments; **"Materials"** means the Article and / or the Video; **"Parties"** means the Author and JoVE; **"Video"** means any video(s) made by the Author, alone or in conjunction with any other parties, or by JoVE or its affiliates or agents, individually or in collaboration with the Author or any other parties, incorporating all or any portion

of the Article, and in which the Author may or may not appear.

2. **Background.** The Author, who is the author of the Article, in order to ensure the dissemination and protection of the Article, desires to have the JoVE publish the Article and create and transmit videos based on the Article. In furtherance of such goals, the Parties desire to memorialize in this Agreement the respective rights of each Party in and to the Article and the Video.

3. **Grant of Rights in Article.** In consideration of JoVE agreeing to publish the Article, the Author hereby grants to JoVE, subject to Sections 4 and 7 below, the exclusive, royalty-free, perpetual (for the full term of copyright in the Article, including any extensions thereto) license (a) to publish, reproduce, distribute, display and store the Article in all forms, formats and media whether now known or hereafter developed (including without limitation in print, digital and electronic form) throughout the world, (b) to translate the Article into other languages, create adaptations, summaries or extracts of the Article or other Derivative Works (including, without limitation, the Video) or Collective Works based on all or any portion of the Article and exercise all of the rights set forth in (a) above in such translations, adaptations, summaries, extracts, Derivative Works or Collective Works and (c) to license others to do any or all of the above. The foregoing rights may be exercised in all media and formats, whether now known or hereafter devised, and include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. If the "Open Access" box has been checked in Item 1 above, JoVE and the Author hereby grant to the public all such rights in the Article as provided in, but subject to all limitations and requirements set forth in, the CRC License.

ARTICLE AND VIDEO LICENSE AGREEMENT

4. **Retention of Rights in Article.** Notwithstanding the exclusive license granted to JoVE in **Section 3** above, the Author shall, with respect to the Article, retain the non-exclusive right to use all or part of the Article for the non-commercial purpose of giving lectures, presentations or teaching classes, and to post a copy of the Article on the Institution's website or the Author's personal website, in each case provided that a link to the Article on the JoVE website is provided and notice of JoVE's copyright in the Article is included. All non-copyright intellectual property rights in and to the Article, such as patent rights, shall remain with the Author.

5. **Grant of Rights in Video – Standard Access.** This **Section 5** applies if the "Standard Access" box has been checked in **Item 1** above or if no box has been checked in **Item 1** above. In consideration of JoVE agreeing to produce, display or otherwise assist with the Video, the Author hereby acknowledges and agrees that, Subject to **Section 7** below, JoVE is and shall be the sole and exclusive owner of all rights of any nature, including, without limitation, all copyrights, in and to the Video. To the extent that, by law, the Author is deemed, now or at any time in the future, to have any rights of any nature in or to the Video, the Author hereby disclaims all such rights and transfers all such rights to JoVE.

6. **Grant of Rights in Video – Open Access.** This **Section 6** applies only if the "Open Access" box has been checked in **Item 1** above. In consideration of JoVE agreeing to produce, display or otherwise assist with the Video, the Author hereby grants to JoVE, subject to **Section 7** below, the exclusive, royalty-free, perpetual (for the full term of copyright in the Article, including any extensions thereto) license (a) to publish, reproduce, distribute, display and store the Video in all forms, formats and media whether now known or hereafter developed (including without limitation in print, digital and electronic form) throughout the world, (b) to translate the Video into other languages, create adaptations, summaries or extracts of the Video or other Derivative Works or Collective Works based on all or any portion of the Video and exercise all of the rights set forth in (a) above in such translations, adaptations, summaries, extracts, Derivative Works or Collective Works and (c) to license others to do any or all of the above. The foregoing rights may be exercised in all media and formats, whether now known or hereafter devised, and include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. For any Video to which this **Section 6** is applicable, JoVE and the Author hereby grant to the public all such rights in the Video as provided in, but subject to all limitations and requirements set forth in, the CRC License.

7. **Government Employees.** If the Author is a United States government employee and the Article was prepared in the course of his or her duties as a United States government employee, as indicated in **Item 2** above, and any of the licenses or grants granted by the Author hereunder exceed the scope of the 17 U.S.C. 403, then the rights granted hereunder shall be limited to the maximum

rights permitted under such statute. In such case, all provisions contained herein that are not in conflict with such statute shall remain in full force and effect, and all provisions contained herein that do so conflict shall be deemed to be amended so as to provide to JoVE the maximum rights permissible within such statute.

8. **Protection of the Work.** The Author(s) authorize JoVE to take steps in the Author(s) name and on their behalf if JoVE believes some third party could be infringing or might infringe the copyright of either the Author's Article and/or Video.

9. **Likeness, Privacy, Personality.** The Author hereby grants JoVE the right to use the Author's name, voice, likeness, picture, photograph, image, biography and performance in any way, commercial or otherwise, in connection with the Materials and the sale, promotion and distribution thereof. The Author hereby waives any and all rights he or she may have, relating to his or her appearance in the Video or otherwise relating to the Materials, under all applicable privacy, likeness, personality or similar laws.

10. **Author Warranties.** The Author represents and warrants that the Article is original, that it has not been published, that the copyright interest is owned by the Author (or, if more than one author is listed at the beginning of this Agreement, by such authors collectively) and has not been assigned, licensed, or otherwise transferred to any other party. The Author represents and warrants that the author(s) listed at the top of this Agreement are the only authors of the Materials. If more than one author is listed at the top of this Agreement and if any such author has not entered into a separate Article and Video License Agreement with JoVE relating to the Materials, the Author represents and warrants that the Author has been authorized by each of the other such authors to execute this Agreement on his or her behalf and to bind him or her with respect to the terms of this Agreement as if each of them had been a party hereto as an Author. The Author warrants that the use, reproduction, distribution, public or private performance or display, and/or modification of all or any portion of the Materials does not and will not violate, infringe and/or misappropriate the patent, trademark, intellectual property or other rights of any third party. The Author represents and warrants that it has and will continue to comply with all government, institutional and other regulations, including, without limitation all institutional, laboratory, hospital, ethical, human and animal treatment, privacy, and all other rules, regulations, laws, procedures or guidelines, applicable to the Materials, and that all research involving human and animal subjects has been approved by the Author's relevant institutional review board.

11. **JoVE Discretion.** If the Author requests the assistance of JoVE in producing the Video in the Author's facility, the Author shall ensure that the presence of JoVE employees, agents or independent contractors is in accordance with the relevant regulations of the Author's institution. If more than one author is listed at the beginning of this Agreement, JoVE may, in its sole

ARTICLE AND VIDEO LICENSE AGREEMENT

discretion, elect not take any action with respect to the Article until such time as it has received complete, executed Article and Video License Agreements from each such author. JoVE reserves the right, in its absolute and sole discretion and without giving any reason therefore, to accept or decline any work submitted to JoVE. JoVE and its employees, agents and independent contractors shall have full, unfettered access to the facilities of the Author or of the Author's institution as necessary to make the Video, whether actually published or not. JoVE has sole discretion as to the method of making and publishing the Materials, including, without limitation, to all decisions regarding editing, lighting, filming, timing of publication, if any, length, quality, content and the like.

12. **Indemnification.** The Author agrees to indemnify JoVE and/or its successors and assigns from and against any and all claims, costs, and expenses, including attorney's fees, arising out of any breach of any warranty or other representations contained herein. The Author further agrees to indemnify and hold harmless JoVE from and against any and all claims, costs, and expenses, including attorney's fees, resulting from the breach by the Author of any representation or warranty contained herein or from allegations or instances of violation of intellectual property rights, damage to the Author's or the Author's institution's facilities, fraud, libel, defamation, research, equipment, experiments, property damage, personal injury, violations of institutional, laboratory, hospital, ethical, human and animal treatment, privacy or other rules, regulations, laws, procedures or guidelines, liabilities and other losses or damages related in any way to the submission of work to JoVE, making of videos by JoVE, or publication in JoVE or elsewhere by JoVE. The Author shall be responsible for, and shall hold JoVE harmless from, damages caused by lack of sterilization, lack of cleanliness or by contamination due to

the making of a video by JoVE its employees, agents or independent contractors. All sterilization, cleanliness or decontamination procedures shall be solely the responsibility of the Author and shall be undertaken at the Author's expense. All indemnifications provided herein shall include JoVE's attorney's fees and costs related to said losses or damages. Such indemnification and holding harmless shall include such losses or damages incurred by, or in connection with, acts or omissions of JoVE, its employees, agents or independent contractors.

13. **Fees.** To cover the cost incurred for publication, JoVE must receive payment before production and publication the Materials. Payment is due in 21 days of invoice. Should the Materials not be published due to an editorial or production decision, these funds will be returned to the Author. Withdrawal by the Author of any submitted Materials after final peer review approval will result in a US\$1,200 fee to cover pre-production expenses incurred by JoVE. If payment is not received by the completion of filming, production and publication of the Materials will be suspended until payment is received.

14. **Transfer, Governing Law.** This Agreement may be assigned by JoVE and shall inure to the benefits of any of JoVE's successors and assignees. This Agreement shall be governed and construed by the internal laws of the Commonwealth of Massachusetts without giving effect to any conflict of law provision thereunder. This Agreement may be executed in counterparts, each of which shall be deemed an original, but all of which together shall be deemed to be one and the same agreement. A signed copy of this Agreement delivered by facsimile, e-mail or other means of electronic transmission shall be deemed to have the same legal effect as delivery of an original signed copy of this Agreement.

A signed copy of this document must be sent with all new submissions. Only one Agreement is required per submission.

CORRESPONDING AUTHOR

Name:	Dr. Paul D. Marasco	
Department:	Biomedical Engineering	
Institution:	Cleveland Clinic, Lerner Research Institute	
Title:	Associate Staff Scientist	
Signature:		Date: 6-29-2018

Please submit a **signed and dated** copy of this license by one of the following three methods:

1. Upload an electronic version on the JoVE submission site
2. Fax the document to +1.866.381.2236
3. Mail the document to JoVE / Attn: JoVE Editorial / 1 Alewife Center #200 / Cambridge, MA 02140

Editorial comments:**1. The editor has formatted the manuscript to match the journal's style. Please retain the same.**

The formatting has been retained.

2. Please address all specific comments marked in the manuscript.

We have thoroughly reviewed and revised the manuscript to address the comments. Changes have been tracked.

3. Please add more details to your protocol steps. Please ensure you answer the “how” question, i.e., how is the step performed?

We have substantially edited and reorganized the protocol to address all the comments and “how” questions throughout the manuscript. It should now contain all the necessary information to allow investigators to implement their previously established prosthetic NMI systems and characterize the development of agency during its operation.

Additionally, the authors feel that perhaps our scope was not clearly stated. To help the reader, we added an explicit scope statement that clearly defines the aim of this protocol as a frame work to evaluate the sense of agency during the operation of previously established NMI prosthetic systems (lines 132-133). NMIs are highly customized experimental systems; therefore, we also added a statement suggesting that using this protocol will require developing a customized and individual master control program to integrate an investigator’s unique NMI control strategies, kinesthetic feedback techniques, and virtual prosthetic system (lines 164-166). The necessary functions/requirements of this program are described throughout the protocol, and have been presented in a manner in which the reader should understand that the specifics technical details relating to software development and hardware integration are beyond the scope of this protocol.

4. The Protocol should contain only action items that direct the reader to do something with specific details with respect to your experiment: hard experimental steps, button clicks, graphical user interface, knob turns etc. This is important for filming purpose.

We have revised the wording throughout the protocol to contain only action items. Additionally, we have made a number of adjustments to the protocol to more appropriately describe the function of the control software and how an investigator will interact with it to perform the experiments.

5. Once done, please check that the protocol is no longer than 10 pages and highlighted section is no longer than 2.75 pages including headings and spacings.

The protocol remains less than 10 pages and less than 2.75 pages have been highlighted.

NOTE: We have removed the use of the word LabVIEW as this is a commercial piece of software. However, the references to MuJoCo were not removed as this is experimental (not commercial) software. Appropriate citations are provided in the text for this software.

License to Publish

The following Grant of License ("License") must be signed and returned to the American Association for the Advancement of Science ("AAAS") before a manuscript can be accepted for publication. If the copyright in the contribution is owned by the author's employer, the employer or an authorized representative must sign this form. In the event that AAAS decides not to publish the Work, this License shall be null and void.

<p>1. In consideration of publication by AAAS in one of its <i>Science</i> journals of the work currently titled _____ and all associated supplemental materials, data, audio and/or video files (the "Work") and authored by _____ ("Author"), the sole and exclusive, irrevocable right is hereby granted to AAAS to publish, reproduce, distribute, transmit, display, store, translate, create derivative works from and otherwise use the Work in any form, manner, format, or medium, whether now known or hereafter developed, throughout the world and in any language, for the entire duration of any such right and any renewal or extension thereof and to permit/sublicense others to do any or all of the foregoing as well.</p>	<p>5. In order that we may preserve the commercial value of our publication, Author agrees to obtain authorization from AAAS in advance for any uses not expressly described in paragraphs 3 or 4.</p>
<p>2. Ownership of the copyright shall remain with the Author, subject to the rights granted to AAAS in paragraph 1. AAAS shall be the holder of title for purpose of registration.</p>	<p>6. Author warrants and represents that the Work is original, that all the facts contained therein are true and accurate, and that the Work has not been published elsewhere, and does not infringe upon any copyright, proprietary, or personal right of any third party. If the Work contains any material that is owned or controlled by a third party, Author certifies that he/she has obtained permission for its use (please attach evidence of this) and that the material is clearly acknowledged within the text.</p> <p>7. Author further warrants and represents that to the extent that Author's right and ability to grant to AAAS all rights specified in Paragraph 1 above is or might be limited by a university policy or other institutional restrictions, Author has obtained a waiver of such policy or restrictions from the applicable university or institution.</p>
<p>3. Author also retains the non-exclusive right to use the Work in the following ways without further permission but only after publication of the Work by AAAS and subject to the requirement that credit be given to its first publication in the appropriate issue of the applicable <i>Science</i> journal: 1) Reprint the Work in print collections of Author's own writings; 2) Reprint the Work in print format for inclusion in a thesis or dissertation that the Author writes; 3) Present the Work orally; 4) Reproduce the Work for use in courses the Author is teaching (If the Author is employed by an academic institution, that institution may also reproduce the Work for course teaching); 5) Distribute photocopies or a PDF of the Work to colleagues for non-commercial purposes only (providing that recipients are informed that they may not further distribute or copy the Work); 6) Post a copy of the "Accepted Version" of the Work (the version of the paper accepted for publication by AAAS including changes resulting from peer review but prior to AAAS's copy editing and production) on the Author's personal website or in his/her Institution's archival database repository, provided a hyperlink to the Work on the <i>Science</i> website is included and provided the "Accepted Version" is marked with the following notice: "This is the author's version of the work. It is posted here by permission of the AAAS for personal use, not for redistribution. The definitive version was published in <i>Science</i> Journal Title {VOL#, (DATE)}, doi: {doi number for your manuscript}"; 7) Reuse figures and tables created by the Author in future works the Author writes; 8) The Author's employer may use the "Accepted Version" of the Work for non-commercial research purposes ("Non-commercial research purposes" is defined as research undertaken for purposes other than (a) a profit motive, (b) for commercial exploitation, (c) monetary gain derived from the outcome of the research, (d) research undertaken on behalf of a commercial entity, or (e) other similar purposes); 9) Author may use or authorize use of Supporting Online Material associated with the Work for any purpose and in any format.</p>	<p>By signing this agreement, Author warrants that he/she has the full power to enter into this agreement. This agreement shall remain in effect throughout the term of copyright in the Work and may not be revoked without the express written consent of both parties.</p> <p>This Agreement shall be governed and construed, and any dispute arising hereunder resolved, in accordance with the laws of the District of Columbia, United States of America, without resort to the conflicts of laws principles thereof.</p> <p>_____ Author's Name (please print)</p> <p>_____ Author's Signature</p> <p>For Authors employed by the United States Government: I attest that the above article was written as part of my official duties as an employee of the U.S. Government (and therefore the article is in the public domain).</p> <p>_____ Author's Name (please print)</p> <p>_____ Author's Signature</p>
<p>4. In addition to the rights retained by the Author in 3 above, authors of research articles, reports, brevias, reviews, or technical comments arising out of grants awarded no earlier than 2 May 2005 who are required by their funding agencies to make their research results publicly available may do so under the following conditions: The Author may cause the posting, no sooner than 6 months after final publication of the Work by AAAS, of the "Accepted Version" of the Work in his/her funding body's archive or designated repository provided it includes a hyperlink to the final published version on the <i>Science</i> website and the full reference citation and provided that further use of the posted article copy is restricted to non-commercial research purposes ("Non-commercial research purposes" is defined as research undertaken for purposes other than (a) a profit motive, (b) for commercial exploitation, (c) monetary gain derived from the outcome of the research, (d) research undertaken on behalf of a commercial entity, or (e) other similar purposes). The "Accepted Version" shall be defined as the version of the paper accepted for publication by AAAS including changes resulting from peer review but prior to AAAS's copy editing and production. This policy does not apply to article types that are not specifically mentioned above. The Author must ensure that the "Accepted Version" is not released on his/her funding body's archive or repository until 6 months after its final publication date in a <i>Science</i> journal.</p>	<p>For works created under U.S. Government Contract: Please sign the top portion of this agreement. The AAAS recognizes the U.S. Government's non-exclusive rights to use the Work for non-commercial, governmental purposes where such rights are established in the grant or contract.</p> <p>Works subject to Crown Copyright: For authors employed by the Australian, Canadian, and/or UK Governments, please contact AAAS for an alternate form.</p>

Provided below is an example set of agency questionnaire statements. The statements are divided according to those intended to quantify the explicit experience of agency (questions 1 through 4), and those intended to be control statements (questions 5 through 8).

1. The virtual hand moved just like I wanted it to, as if it was obeying my will.

Strongly disagree						Strongly agree
-3	-2	-1	0	1	2	3

2. I felt as if I was controlling the movements of the virtual hand.

Strongly disagree						Strongly agree
-3	-2	-1	0	1	2	3

3. I felt as if I caused the movement I saw.

Strongly disagree						Strongly agree
-3	-2	-1	0	1	2	3

4. Whenever I moved my hand, I expected the virtual hand to move in the same way.

Strongly disagree						Strongly agree
-3	-2	-1	0	1	2	3

5. I felt as if the virtual hand was controlling my will.

Strongly disagree						Strongly agree
-3	-2	-1	0	1	2	3

6. I felt as if the virtual hand was controlling my movements.

Strongly disagree						Strongly agree
-3	-2	-1	0	1	2	3

7. I could sense the movement from somewhere between my residual limb and virtual hand.

Strongly disagree						Strongly agree
-3	-2	-1	0	1	2	3

8. It seemed as if the virtual hand had a will of its own.

Strongly
disagree

Strongly
agree
