

Diagnostic suspicion

Screening test

**Functional or cognitive alterations
are verified**

YES

Clinical follow-up

Occurrence of memory complaints or other cognitive deficits;
Unjustified and persistent changes in mood, behavior or
personality;
Difficulties in carrying out advanced and instrumental activities
of daily life.
It is essential that these signs are corroborated by a reliable
informant.

- **Detailed history**
- **Test to assess functional loss AIDL**
- **Lab tests**
 - Hemogram, to rule out anemia
 - TSH, to rule out hypothyroidism
 - Ionogram, to rule out diabetes
 - Vitamin B12, to rule out its deficit
 - Folate, in case of celiac disease or poor cereal intake
 - Depending on the clinic: determine liver and kidney function, ESR, luteal serology and HIV
- **Derivation/collaborative follow-up with Specialized Care for diagnosis and possible treatment**
