Dear editor,

We are pleased to present our manuscript for “Antibiotic dereplication using the Antibiotic Resistance Platform”.

Our paper describes the need for a more comprehensive method for dereplicating natural product antibiotics derived from Actinobacteria and other microbes that does not require the use of expensive analytical equipment or sophisticated data interpretation. To provide a solution to this problem, we introduce the Antibiotic Resistance Platform (ARP) and Minimal Antibiotic Resistance Platform (MARP). These platforms utilize a library of isogenic *Escherichia coli* strains expressing individual resistance genes that are effective against the most commonly re-discovered antibiotics. When this library is grown in the presence of an antibiotic-producing organism, the identity of the compound can be deduced by the growth of the *E. coli* indicator strain expressing the associated resistance gene. Our *E. coli* library is currently comprised of over >90 resistance genes that confer resistance to 18 antibiotic classes.

We believe that the Journal of Visualized Experiments (JoVE) is the most appropriate journal for us to submit this manuscript to because interest for the ARP and/or MARP library has been expressed worldwide, and in response it is important to provide users with a detailed protocol. Although this dereplication method does not require extensive equipment or data interpretation, there are a number of techniques that are important to be followed in order for the method to be carried out successfully. With the help of the detailed instruction videos prepared by JoVE, our protocol can be appropriately demonstrated and distributed to those interested.

Sincerely,

Haley L. Zubyk

Georgina Cox

antibiotic, dereplication, drug discovery, actinomycetes, *Escherichia coli*, secondary metabolite, resistance enzymes, natural product

**SUMMARY:**

We describe a platform that utilizes a library of isogenic antibiotic resistant *Escherichia coli* for the dereplication of antibiotics. The identity of an antibiotic produced by bacteria or fungi can be deduced by the growth of *E. coli* expressing its respective resistance gene. This platform is economically effective and time-efficient.

**ABSTRACT:**

One of the main challenges in the search for new antibiotics from natural product extracts is the re-discovery of common compounds. To address this challenge, dereplication, which is the process of identifying known compounds, is performed on samples of interest. Methods for dereplication such as analytical separation followed by mass spectrometry are time-consuming and resource-intensive. To improve the dereplication process, we have developed the antibiotic resistance platform (ARP). The ARP is a library of approximately 100 antibiotic resistance genes that have been individually cloned into *Escherichia coli*. This strain collection has many applications, including a cost-effective and facile method for antibiotic dereplication. The process involves the fermentation of antibiotic-producing microbes on the surface of rectangular Petri dishes containing solid medium, thereby allowing for the secretion and diffusion of secondary metabolites through the medium. After a 6-day fermentation period, the microbial biomass is removed, and a thin agar-overlay is added to the Petri dish to create a smooth surface and enable the growth of the *E. coli* indicator strains. Our collection of ARP strains is then pinned onto the surface of the antibiotic-containing Petri dish. The plate is next incubated overnight to allow for *E. coli* growth on the surface of the overlay. Only strains containing resistance to a specific antibiotic (or class) grow on this surface enabling rapid identification of the produced compound.

This method has been successfully used for the identification of producers of known antibiotics and as a means to identify those producing novel compounds.

## INTRODUCTION:

Since the discovery of penicillin in 1928, natural products derived from environmental microorganisms have proven to be a rich source of antimicrobial compounds<sup>1</sup>. Approximately 80% of natural product antibiotics are derived from bacteria of the genus *Streptomyces* and other actinomycetes, while the remaining 20% is produced by fungal species<sup>1</sup>. Some of the most common antibiotic scaffolds used in the clinic such as the  $\beta$ -lactams, tetracyclines, rifamycins, and aminoglycosides, were originally isolated from microbes<sup>2</sup>. However, due to the rise of multidrug resistant (MDR) bacteria, our current panel of antibiotics has become less effective in treatment<sup>3,4</sup>. These include the “ESKAPE” pathogens (i.e., vancomycin-resistant enterococci and  $\beta$ -lactam-resistant *Staphylococcus aureus*, *Klebsiella pneumoniae*, *Pseudomonas aeruginosa*, *Acinetobacter baumannii*, and *Enterobacter* sp.), which are a subset of bacteria deemed to be associated with the highest risk by a number of major public health authorities such as the World Health Organization<sup>3-5</sup>. The emergence and global spread of these MDR pathogens results in a constant need for novel antibiotics<sup>3-5</sup>. Regrettably, the past two decades have demonstrated that the discovery of novel antibiotics from microbial sources is increasingly difficult<sup>6</sup>. Current approaches to drug discovery include the high-throughput screening of bioactive compounds, including natural product extract libraries, allowing for thousands of extracts to be tested at a given time<sup>2</sup>. However, once antimicrobial activity is detected, the next step is to analyze the contents of the crude extract to identify the active component and eliminate those containing known or redundant compounds<sup>7,8</sup>. This process, referred to as dereplication, is vital to prevent and/or significantly reduce the time spent on the re-discovery of known antibiotics<sup>7,9</sup>. Although a necessary step in natural product drug discovery, dereplication is notoriously laborious and resource-intensive<sup>10</sup>.

Ever since Beutler et al. first coined the term “dereplication”, extensive efforts have been made to develop innovative strategies for the rapid identification of known antibiotics<sup>11,12</sup>. Today the most common tools used for dereplication include analytical chromatographic systems such as high-performance liquid chromatography, mass spectrometry, and nuclear magnetic resonance-based detection methods<sup>11,13</sup>. Unfortunately, each of these methods requires the use of expensive analytical equipment and sophisticated data interpretation.

In an attempt to develop a dereplication method that can be rapidly performed without specialized equipment, we established the antibiotic resistance platform (ARP)<sup>10</sup>. The ARP can be used for the discovery of antibiotic adjuvants, the profiling of new antibiotic compounds against known resistance mechanisms, and the dereplication of known antibiotics in extracts derived from actinobacteria and other microbes. Here, we focus on its application in antibiotic dereplication. The ARP utilizes a library of isogenic *Escherichia coli* strains expressing individual resistance genes that are effective against the most commonly re-discovered antibiotics<sup>14,15</sup>. When the *E. coli* library is grown in the presence of a secondary metabolite-producing organism, the identity of the compound can be deduced by the growth of *E. coli* strains that express its associated resistance gene<sup>10</sup>. When the ARP was first reported, the library consisted of >40 genes

conferring resistance to 16 antibiotic classes. The original dereplication template was designed to encompass a subset of resistance genes per antibiotic class to provide information regarding antibiotic subclass during the dereplication process. Today, the ARP is comprised of >90 genes that confer resistance to 18 antibiotic classes. Using our extensive collection of resistance genes, a secondary dereplication template has been developed and is known as the minimal antibiotic resistance platform (MARP). This template was created to eliminate gene redundancy and to simply provide information regarding the general antibiotic class that a dereplicated metabolite is related to. Additionally, the MARP template possesses both wildtype and a hyperpermeable/efflux deficient strain of *E. coli* BW25113 (*E. coli* BW25113  $\Delta$ *bamB* $\Delta$ *tolC*), compared to the original incarnation of the ARP, which only utilizes the hyperpermeable strain. This unique aspect creates additional phenotypes during dereplication, indicating a compounds ability to cross the outer membrane of Gram-negative bacteria. Here, we describe a robust protocol to be followed when dereplicating with either the ARP and/or MARP, highlight the most critical steps to be followed, and discuss the various possible outcomes.

## PROTOCOL:

### 1. Preparation of *E. coli* library glycerol stocks (from agar slants)

1.1. Streak the ARP/MARP *E. coli* strains from lysogeny broth (LB) agar slants onto Petri dishes containing LB agar and the appropriate selectable marker (**Table 1**).

1.2. Prepare cultures for each of the *E. coli* strains by inoculating 3 mL of LB containing the appropriate selectable marker with a single colony. Grow overnight at 37 °C with aeration (250 rpm).

1.3. Combine 800  $\mu$ L of culture and 200  $\mu$ L of sterile 80% glycerol in a 1.8 mL cryovial. Mix by inverting the tubes 3–4 times, and store at -80 °C.

### 2. ARP/MARP frozen stock library plate preparation

2.1. Streak the ARP/MARP strains from the glycerol stocks prepared in section 1 onto a new set of Petri dishes containing LB agar and the appropriate selectable marker. Grow overnight at 37 °C.

2.2. Using aseptic technique, pipette 500  $\mu$ L of cation adjusted Mueller Hinton broth (MHB) from a sterile reservoir into each well of a sterile 96 deep well plate.

2.3. With the plates prepared in step 2.1, use an applicator stick to inoculate the 96 deep well plate in accordance with the ARP/MARP map (**Supplemental Figure 1** and **Supplemental Figure 2**). Ensure that the appropriate selectable marker is added to each well. Incubate the deep well plate overnight at 37 °C with aeration (250 rpm).

2.4. Ensure that there are no contaminated wells by referring to the ARP/MARP map. Repeat if

contaminated. Using a multi-channel pipettor, transfer 100  $\mu$ L from each well of the deep well plate to a sterile 96-well round bottom plate. Repeat this step to create multiple frozen stock library plates.

NOTE: It is best to prepare at least 5 library plates at a time to keep from repeating steps 2.1–2.4 in the event of frozen stock library plate contamination.

2.5. Finish making the ARP/MARP frozen stock library plates by pipetting 100  $\mu$ L of sterile 50% glycerol into each well and mix by gently pipetting up and down.

2.6. Cover the plates with sterile aluminum seals and ensure that each well is individually sealed.

2.7. Number the plates and dedicate only one frozen stock library plate for inoculating new templates at a given time. Keep the remainder as back-ups in the event of frozen stock library plate contamination.

2.8. Place the plate lid on top of the aluminum seal and store at -80 °C.

### 3. Seed culture and dereplication plate preparation

3.1. Using an applicator stick, inoculate 3 mL of *Streptomyces* antibiotic medium (SAM) (or other appropriate medium for the organism being tested) in a test tube containing one sterile glass bead (to break-up the mycelium) with the producing strain that is to be dereplicated. For *Streptomyces*, gently scrape spores from the surface of a colony.

3.2. Using the same wooden applicator stick, streak a sterility control on a Petri dish containing Bennett's agar.

3.3. Incubate the seed culture at 30 °C with aeration for 6 days (250 rpm) and incubate the sterility control plate at 30 °C for 6 days.

NOTE: Refer to **Table 2** for SAM and Bennett's media recipes. The above instructions are suitable for most actinomycetes. Alter growth media as necessary for other bacteria and fungi.

3.4. Prepare dereplication plates by aspirating 23 mL of Bennett's agar into a serological pipette and dispense 20 mL evenly across the surface of a rectangular Petri dish (**Table of Materials**), leaving the remainder of the medium in the pipette to prevent air bubble formation.

NOTE: Ensure that the surface being used to pour plates is level and perform this step before the agar has cooled too much; a flat surface is imperative for library pinning in the next stages.

3.5. Gently rotate the plate until the medium covers all areas of the plate and do not disturb it until the agar has set completely.

3.6. Prepare nitrocellulose membrane sheets (**Table of Materials**) by using a rectangular Petri dish lid as a tracing template so that the sheets fit the surface of the dereplication plate. Cut the sheets and autoclave them in a sterile pouch.

NOTE: This membrane allows for organisms to sporulate on its surface, while secondary metabolites may be excreted into the medium below. Once grown, the membrane is removed to provide a clean surface for dereplication. The closer fit that the membrane paper has on the surface of the Bennett's agar, the cleaner the dereplication result.

3.7. Check the sterility control plate to ensure that no contaminants are present after 6 days of incubation. If contamination-free, remove the lid of the rectangular Petri dish and pipette 200  $\mu$ L of seed culture onto the surface of the Bennett's agar.

3.8. Evenly spread the culture across the surface of the entire plate using a sterile cotton swab.

3.9. Place the nitrocellulose membrane prepared in step 3.6 over top of the culture on the surface of the Petri dish. Begin by aligning the bottom edge of the membrane to the bottom edge of the Petri dish, and slowly apply the membrane from the bottom edge to the top edge of the plate.

3.10. Use a sterile cotton swab to smooth out any air bubbles that may have formed between the membrane-agar interface, ensuring that the membrane is flush to the agar.

3.11. Put the lid back on the rectangular Petri dish and place it upside down in a sealed plastic bag. Incubate at 30 °C for 6 days.

#### **4. Dereplication plate MHB overlay and ARP/MARP library plate preparation**

4.1. After 6 days, remove the dereplication plate from the 30 °C incubator. Using sterile tweezers (autoclaved or sprayed thoroughly with 70% ethanol), carefully remove the nitrocellulose membrane from the surface of the Bennett's agar.

NOTE: This step will remove the hydrophobic spores and mycelia grown on the surface of the membrane to provide a clean surface for dereplication, facilitating step 4.2.

4.2. As described for step 3.4, ensure the work surface is level and use a serological pipette to aspirate 23 mL of cation adjusted MHB agar. Create an overlay by dispensing 20 mL evenly across the surface of the dereplication plate, leaving the remainder of the medium in the pipette to prevent air bubble formation.

4.3. Gently rotate the plate until the medium covers all areas and do not disturb it until the agar has set completely. Once cooled and solidified, return the dereplication plate to the sealed plastic bag and store it upside at 4 °C overnight.

NOTE: This step allows for diffusion of secondary metabolites from the fermented Bennett's medium into the MHB agar overlay. If the nitrocellulose membrane was not prepared properly there will be spore growth around the edges of the plate, which have hydrophobic properties that repel the MHB agar. Do not pour the overlay on top of these spores because it can result in contamination of the overlay.

4.4. On the same day that the overlay is poured, inoculate a fresh ARP/MARP template by pipetting 100  $\mu$ L of cation adjusted MHB into each well of a 96-well plate.

NOTE: To reduce the chance of spreading contamination during dereplication, use a single ARP/MARP library plate to only derePLICATE 2–3 dereplication plates. Therefore, inoculate enough 96-well ARP/MARP plates based on the number of strains that will be dereplicated.

4.5. Take the frozen stock ARP/MARP library plate out of the -80 °C freezer. Remove the aluminum seal before condensation begins to form on its underside, thereby decreasing the chance of contaminating neighboring wells in the library plate.

4.6. Using 96-well pinning tools (or other forms of inoculation equipment), carefully pin from the frozen stock ARP/MARP library plate and inoculate the fresh MHB-containing 96-well plates.

4.7. Put a new sterile aluminum seal on the frozen template once complete and return it to the -80 °C freezer. Place the inoculated 96-well plates inside of a sealed plastic bag and incubate at 37 °C with aeration (250 rpm) for 18 h.

NOTE: New frozen stock library plates can be prepared from this step after ensuring that no contamination is present. Add glycerol to the plate before storing at -80 °C as described in step 2.5.

## 5. Dereplicating using the ARP/MARP

5.1. Remove the ARP/MARP template from the incubator and ensure that no contaminants are present. Always derePLICATE using a template that is freshly prepared and not directly from the frozen stock.

5.2. Remove the dereplication plates from 4 °C and allow to equilibrate to room temperature. If there is condensation, open the lids and allow to dry in a sterile environment.

5.3. Using pinning tools (or other inoculation equipment), pin from the ARP/MARP library plate onto the surface of the MHB agar overlay of the dereplication plates. Be careful not to pierce the agar.

5.4. After pinning the template onto the surface of the dereplication plates, allow the template inoculum to dry for 3–5 min. Place the inoculated dereplication plates upside down in a sealed plastic bag and incubate overnight at 37 °C.

5.5. Analyze dereplication results the following day by comparing growth on the dereplication plate to wells that correspond to the ARP/MARP map (Table 3 and Table 4).

#### REPRESENTATIVE RESULTS:

The following results were obtained when a collection of antibiotic-producing strains of interest were dereplicated using the ARP and/or MARP.

A diagram of the ARP/MARP dereplication workflow is depicted in **Figure 1**, and library plate maps are shown in **Supplemental Figure 1** and **Supplemental Figure 2**. **Figure 2** demonstrates a positive dereplication result wherein the environmental extract WAC 8921 is identified as a chloramphenicol producer. **Figure 3** shows a lack of ARP growth entirely, which indicates the presence of either an unknown antibiotic or a less commonly found antibiotic that is not accounted for in the ARP/MARP library plate. **Figure 4** demonstrates a growth pattern that is unique to the MARP because of its utilization of both wildtype *E. coli* BW25113 and a hyperpermeable and efflux deficient mutant *E. coli* BW25113  $\Delta bamB \Delta tolC$ . This result suggests the presence of a compound with antimicrobial activity that is unable to surpass an intact outer membrane. **Figure 5** shows an *E. coli* growth pattern that suggests the improper sterilization of pinning tools and **Figure 6** shows an example of ARP/MARP frozen stock library plate contamination. **Figure 7** demonstrates what happens if the agar overlay is pierced during dereplication. Lastly, **Figure 8** shows MHB overlay related contamination that can occur during the dereplication process.

#### FIGURE AND TABLE LEGENDS:

**Figure 1: A schematic of the dereplication process.** The producing strain to be dereplicated is streaked onto a rectangular Petri dish as a lawn and a nitrocellulose membrane is placed on top. The plate is then incubated for 6 days wherein the producing-strain related biomass grows on the surface of the membrane while and secondary metabolites produced are secreted into the Petri dish media. After a 6-day fermentation period, the membrane is removed and an MHB overlay is added to the surface of the antibiotic-containing media to provide a smooth surface for pinning. The ARP/MARP *E. coli* library, which is arranged in a 96-well plate format according to the ARP/MARP Maps, is then pinned onto the surface of the overlay. After incubating the tray overnight at 37 °C, the growth of *E. coli* strains expressing specific resistance genes indicates the identity of the compound produced.

**Figure 2: Dereplication of a known antibiotic.** The producing strain WAC 8921 was dereplicated using the ARP template. Growth of *E. coli* BW25113  $\Delta bamB \Delta tolC$  pGDP1:CAT on the surface of the MHB agar overlay indicates that WAC 8921 is a chloramphenicol producer.

**Figure 3: Dereplication of an unknown antibiotic.** The producing strain WAC 9941 was dereplicated using the ARP template. A lack of *E. coli* library growth was seen on the surface of the rectangular Petri dish, indicating that either WAC 9441 is producing an unknown antimicrobial compound or a rare antibiotic that is not accounted for in the ARP.

**Figure 4: Identification of an antimicrobial compound that cannot traverse an intact outer membrane.** The producing strain WAC 4178 was dereplicated using the MARP template. Strains of *E. coli* BW25113 are capable of growing on the surface of the secondary metabolite-containing media, whereas all strains of *E. coli* BW25113  $\Delta bamB\Delta tolC$  cannot grow. This suggests that WAC 4178 is producing an antimicrobial compound that cannot traverse an intact outer membrane.

**Figure 5: Contamination due to non-sterile pinning tools.** The producing strain WAC 7094 was dereplicated using the ARP template. The presence of *E. coli* library growth in areas that did not have an assigned *E. coli* strain suggests that the pinning tools used to inoculate the MHB agar overlay of the rectangular Petri dish were not properly sterilized. This results in the transfer of unknown *E. coli* strains across the overlay.

**Figure 6: Contamination due to a contaminated frozen stock ARP/MARP template.** The producing strain WAC 3683 was dereplicated using the ARP template. Three distinct *E. coli* colonies grew on the rectangular Petri dish surface: two correspond with *E. coli* BW25113  $\Delta bamB\Delta tolC$  expressing STAT, a streptothricin resistance enzyme, and the other corresponds to *E. coli* BW25113  $\Delta bamB\Delta tolC$  expressing VIM-2<sub>ss</sub>, a  $\beta$ -lactam resistance enzyme. Due to a lack of replicating *bla*<sub>VIM2ss</sub> colony growth, in addition to the lack of cross-resistance known to occur between these two antibiotic classes, it can be assumed that a strain other than *E. coli*  $\Delta bamB\Delta tolC$  pGDP1: *bla*<sub>VIM2ss</sub> is growing in the respective frozen library plate well.

**Figure 7: Pierced MHB agar overlay.** The producing strain WAC 5106 was dereplicated using the ARP template. This strain was found to be a streptomycin producer, as indicated by the growth of *E. coli* BW25113  $\Delta bamB\Delta tolC$  pGDP3:*aph(6)-Ia*. Puncture holes can be seen on the surface of the MHB agar overlay along the perimeter of the plate. While this does not affect the dereplication results, it can make the data difficult to interpret at first glance.

**Figure 8: Contamination of the MHB agar overlay.** Contaminated MHB agar produces an irregular growth pattern on the surface of the overlay that becomes visible after incubating the plate overnight at 37 °C. Although *E. coli* growth may still be visible through the contamination, it is advised to repeat the experiment before extrapolating data from the plate.

**Table 1: Selectable markers used in the pGDP plasmid series.** Streak the ARP/MARP *E. coli* strains onto LB agar Petri dishes containing the appropriate selectable marker at the right concentration for each plasmid.

**Table 2: Recipes for SAM and Bennett's media, and Czapek mineral mix.** Adjust SAM and Bennett's to pH 6.8 before autoclaving, and filter sterilize the Czapek mineral mix.

**Table 3: Well designation table for the minimal ARP strains.** This table indicates which well of a 96-well plate that each of the minimal ARP strains can be found in according to the minimal ARP library plate map. The table also lists which antibiotic class each gene confers resistance to. Please note that some genes may confer resistance to more than one antibiotic within the given

antibiotic class.

**Table 4: Well designation table for the ARP strains.** This table indicates which well of a 96-well plate that each of the ARP strains can be found in according to the ARP library plate map. The table also lists which antibiotic class each gene confers resistance to. Please note that some genes may confer resistance to more than one antibiotic within the given antibiotic class.

**Supplemental Figure 1: Library plate map used for the original antibiotic resistance platform (ARP) template.** Organize the respective *E. coli* strains in a 96-well plate using this format to ensure that all necessary controls and duplicates are included. This figure has been modified from Cox et al.<sup>10</sup>.

**Supplemental Figure 2: Library plate map used for the minimal antibiotic resistance platform (MARP) template.** Organize the respective *E. coli* strains in a 96-well plate using this format to ensure that all necessary controls and duplicates are included.

#### DISCUSSION:

The protocol described above can be applied to both the discovery of novel antimicrobial compounds and adjuvants that can be used in conjunction with existing antibiotics to rescue their activity. The platform takes advantage of the high substrate specificity of resistance mechanisms and their cognate antibiotics, to dereplicate compounds within crude natural product extracts. Although the time required for dereplication plates to be prepared is lengthy (~2 weeks), the dereplication process itself is complete after a single overnight incubation period, which is rapid in comparison to the time it can take to isolate and characterize a compound from crude extracts. Additionally, no expensive or highly specialized equipment is required, making this platform accessible and cost-effective.

Another major benefit of this platform is its flexibility. The ARP can be expanded to contain resistance genes that encompass more antibiotic classes. This is achieved by monitoring literature for the emergence of novel resistance enzymes and using basic molecular cloning techniques to add the genes to the *E. coli* library. Furthermore, the dereplication template is customizable based on the desired level of broad or narrow range substrate specificity that an individual wants to use when dereplicating. Any combination of genes in the *E. coli* library can be used to make novel library plates with the ability to detect compounds with different profiles. For example, a  $\beta$ -lactamase expressing *E. coli* template could be developed to allow for the highly specific dereplication of  $\beta$ -lactams and their different subclasses.

While this platform was initially designed to dereplicate compounds on solid media, it also been works in liquid media. This is useful when working with compounds that have already been purified wherein only a limited amount is available for testing, or when working with compounds that do not diffuse easily or consistently in solid media. Lastly, while this protocol was described using the *E. coli* strains BW25113 and BW25113  $\Delta bamB \Delta tolC$ , the platform can be used with the resistance gene library expressed in different strains of *E. coli* (dereplication phenotypes may vary). Ultimately, the Antibiotic Resistance Platform is flexible, has many applications, and is

397 advantageous over other dereplication methods.  
398

399 To ensure that reproducible and non-contaminated results are obtained, it is critical to follow  
400 appropriate sterilization and aseptic techniques. Failure to do so will result in contamination of  
401 the pinning tools, library plate, or the dereplication plate itself. While selectable markers are  
402 present in the *E. coli* library, which can help prevent contamination caused by bacteria missing  
403 the marker, it does not prevent the cross-contamination of strains using the same marker. To  
404 reduce the risk of this happening it is essential to carefully sterilize the bacterial pinning tools  
405 before pinning from the library plate. Each library plate should only be pinned from 3–4 times  
406 maximum before discarding for a new template. This prevents the spread of contamination  
407 across all dereplication plates if a library plate becomes contaminated during the pinning process.  
408 Additionally, no antibiotics are used when inoculating the dereplication plate and so great care  
409 must be taken to prevent contamination before it is left to ferment for six days. Another possible  
410 source of contamination is in the MHB agar overlay of the dereplication plate. If the overlay  
411 media is contaminated, growth will only appear after the overnight incubation at 37 °C post-  
412 pinning. Overlay contamination can make it extremely difficult to analyze the growth of the *E.*  
413 *coli* library on the overlay surface. To reduce the chances of overlay contamination, prepare MHB  
414 agar fresh before pouring the overlay. It is recommended that until an individual is comfortable  
415 with this method, dereplication plates should always be prepared in duplicate or triplicate such  
416 that in the event of contamination of one plate, data can still be extracted from the hopefully  
417 non-contaminated plates.  
418

419 Lastly, it is important to note that the ARP/MARP has limitations. This protocol is not suitable for  
420 the de-replication of producing-strains that produce more than one bioactive compound. Each  
421 strain in the *E. coli* library has been designed to express a single resistance gene. If two antibiotics  
422 are being produced by an organism, neither resistance gene will confer resistance to the second  
423 antibiotic, thereby resulting in cell death of both strains. Thus, this possibility must be considered  
424 when dereplication results suggest the presence of a novel antibiotic because the production of  
425 multiple antibiotics cannot be detected by the current single construct *E. coli* library. One  
426 approach that can be taken to combat the challenge of dereplicating strains that produce more  
427 than one antibiotic involves using the agar-plug procedure described in the original ARP paper by  
428 Cox et al.<sup>10</sup>. In this method, a portion of a fermented solid medium is removed from an antibiotic-  
429 producer containing plate and placed onto a lawn of indicator ARP strain. The indicator strain can  
430 be any of the resistant *E. coli* strains in the ARP library. Zones of inhibition are then used to  
431 compare the bioactivity of a producing-strain against the ARP strains and a wild-type strain. ARP  
432 strains that form an inhibitory zone of decreased size compared to the wild-type strain can resist  
433 the compound being produced. This method has proven to be effective at identifying strains  
434 capable of producing multiple antibiotics<sup>10</sup>.  
435

436 In summary, for obtaining the best results when dereplicating with the ARP/MARP it is  
437 recommended that dereplication plates are prepared in duplicate or triplicate. Other critical  
438 steps in the protocol include pinning from a fresh library plate (never frozen) and removing as  
439 much biomass as possible from the producing-strain during the membrane removal stage. If all  
440 necessary steps are followed, one should have successful dereplication results for a producing-

strain of interest within a two-week time frame.

#### ACKNOWLEDGMENTS:

Research in the Wright lab pertaining to the ARP/MARP was supported by the Ontario Research Fund and Canadian Institutes of Health Research grant (FRN-148463). We would like to acknowledge Sommer Chou for assisting in the expansion and organization of the ARP library.

#### DISCLOSURES:

The authors have nothing to disclose.

## ARTICLE AND VIDEO LICENSE AGREEMENT

Title of Article:

Antibiotic dereplication using the Antibiotic Resistance Platform

Author(s):

Haley L. Zubyk, Georgina Cox, Gerard D. Wright

Item 1: The Author elects to have the Materials be made available (as described at <http://www.jove.com/publish>) via:

Standard Access

Open Access

Item 2: Please select one of the following items:

The Author is **NOT** a United States government employee.

The Author is a United States government employee and the Materials were prepared in the course of his or her duties as a United States government employee.

The Author is a United States government employee but the Materials were NOT prepared in the course of his or her duties as a United States government employee.

### ARTICLE AND VIDEO LICENSE AGREEMENT

1. **Defined Terms.** As used in this Article and Video License Agreement, the following terms shall have the following meanings: “**Agreement**” means this Article and Video License Agreement; “**Article**” means the article specified on the last page of this Agreement, including any associated materials such as texts, figures, tables, artwork, abstracts, or summaries contained therein; “**Author**” means the author who is a signatory to this Agreement; “**Collective Work**” means a work, such as a periodical issue, anthology or encyclopedia, in which the Materials in their entirety in unmodified form, along with a number of other contributions, constituting separate and independent works in themselves, are assembled into a collective whole; “**CRC License**” means the Creative Commons Attribution-Non Commercial-No Derivs 3.0 Unported Agreement, the terms and conditions of which can be found at: <http://creativecommons.org/licenses/by-nc-nd/3.0/legalcode>; “**Derivative Work**” means a work based upon the Materials or upon the Materials and other pre-existing works, such as a translation, musical arrangement, dramatization, fictionalization, motion picture version, sound recording, art reproduction, abridgment, condensation, or any other form in which the Materials may be recast, transformed, or adapted; “**Institution**” means the institution, listed on the last page of this Agreement, by which the Author was employed at the time of the creation of the Materials; “**JoVE**” means MyJoVE Corporation, a Massachusetts corporation and the publisher of The Journal of Visualized Experiments; “**Materials**” means the Article and / or the Video; “**Parties**” means the Author and JoVE; “**Video**” means any video(s) made by the Author, alone or in conjunction with any other parties, or by JoVE or its affiliates or agents, individually or in collaboration with the Author or any other parties, incorporating all or any portion

of the Article, and in which the Author may or may not appear.

2. **Background.** The Author, who is the author of the Article, in order to ensure the dissemination and protection of the Article, desires to have the JoVE publish the Article and create and transmit videos based on the Article. In furtherance of such goals, the Parties desire to memorialize in this Agreement the respective rights of each Party in and to the Article and the Video.

3. **Grant of Rights in Article.** In consideration of JoVE agreeing to publish the Article, the Author hereby grants to JoVE, subject to **Sections 4** and **7** below, the exclusive, royalty-free, perpetual (for the full term of copyright in the Article, including any extensions thereto) license (a) to publish, reproduce, distribute, display and store the Article in all forms, formats and media whether now known or hereafter developed (including without limitation in print, digital and electronic form) throughout the world, (b) to translate the Article into other languages, create adaptations, summaries or extracts of the Article or other Derivative Works (including, without limitation, the Video) or Collective Works based on all or any portion of the Article and exercise all of the rights set forth in (a) above in such translations, adaptations, summaries, extracts, Derivative Works or Collective Works and (c) to license others to do any or all of the above. The foregoing rights may be exercised in all media and formats, whether now known or hereafter devised, and include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. If the “Open Access” box has been checked in **Item 1** above, JoVE and the Author hereby grant to the public all such rights in the Article as provided in, but subject to all limitations and requirements set forth in, the CRC License.

## ARTICLE AND VIDEO LICENSE AGREEMENT

4. **Retention of Rights in Article.** Notwithstanding the exclusive license granted to JoVE in **Section 3** above, the Author shall, with respect to the Article, retain the non-exclusive right to use all or part of the Article for the non-commercial purpose of giving lectures, presentations or teaching classes, and to post a copy of the Article on the Institution's website or the Author's personal website, in each case provided that a link to the Article on the JoVE website is provided and notice of JoVE's copyright in the Article is included. All non-copyright intellectual property rights in and to the Article, such as patent rights, shall remain with the Author.

5. **Grant of Rights in Video – Standard Access.** This **Section 5** applies if the "Standard Access" box has been checked in **Item 1** above or if no box has been checked in **Item 1** above. In consideration of JoVE agreeing to produce, display or otherwise assist with the Video, the Author hereby acknowledges and agrees that, Subject to **Section 7** below, JoVE is and shall be the sole and exclusive owner of all rights of any nature, including, without limitation, all copyrights, in and to the Video. To the extent that, by law, the Author is deemed, now or at any time in the future, to have any rights of any nature in or to the Video, the Author hereby disclaims all such rights and transfers all such rights to JoVE.

6. **Grant of Rights in Video – Open Access.** This **Section 6** applies only if the "Open Access" box has been checked in **Item 1** above. In consideration of JoVE agreeing to produce, display or otherwise assist with the Video, the Author hereby grants to JoVE, subject to **Section 7** below, the exclusive, royalty-free, perpetual (for the full term of copyright in the Article, including any extensions thereto) license (a) to publish, reproduce, distribute, display and store the Video in all forms, formats and media whether now known or hereafter developed (including without limitation in print, digital and electronic form) throughout the world, (b) to translate the Video into other languages, create adaptations, summaries or extracts of the Video or other Derivative Works or Collective Works based on all or any portion of the Video and exercise all of the rights set forth in (a) above in such translations, adaptations, summaries, extracts, Derivative Works or Collective Works and (c) to license others to do any or all of the above. The foregoing rights may be exercised in all media and formats, whether now known or hereafter devised, and include the right to make such modifications as are technically necessary to exercise the rights in other media and formats. For any Video to which this **Section 6** is applicable, JoVE and the Author hereby grant to the public all such rights in the Video as provided in, but subject to all limitations and requirements set forth in, the CRC License.

7. **Government Employees.** If the Author is a United States government employee and the Article was prepared in the course of his or her duties as a United States government employee, as indicated in **Item 2** above, and any of the licenses or grants granted by the Author hereunder exceed the scope of the 17 U.S.C. 403, then the rights granted hereunder shall be limited to the maximum

rights permitted under such statute. In such case, all provisions contained herein that are not in conflict with such statute shall remain in full force and effect, and all provisions contained herein that do so conflict shall be deemed to be amended so as to provide to JoVE the maximum rights permissible within such statute.

8. **Protection of the Work.** The Author(s) authorize JoVE to take steps in the Author(s) name and on their behalf if JoVE believes some third party could be infringing or might infringe the copyright of either the Author's Article and/or Video.

9. **Likeness, Privacy, Personality.** The Author hereby grants JoVE the right to use the Author's name, voice, likeness, picture, photograph, image, biography and performance in any way, commercial or otherwise, in connection with the Materials and the sale, promotion and distribution thereof. The Author hereby waives any and all rights he or she may have, relating to his or her appearance in the Video or otherwise relating to the Materials, under all applicable privacy, likeness, personality or similar laws.

10. **Author Warranties.** The Author represents and warrants that the Article is original, that it has not been published, that the copyright interest is owned by the Author (or, if more than one author is listed at the beginning of this Agreement, by such authors collectively) and has not been assigned, licensed, or otherwise transferred to any other party. The Author represents and warrants that the author(s) listed at the top of this Agreement are the only authors of the Materials. If more than one author is listed at the top of this Agreement and if any such author has not entered into a separate Article and Video License Agreement with JoVE relating to the Materials, the Author represents and warrants that the Author has been authorized by each of the other such authors to execute this Agreement on his or her behalf and to bind him or her with respect to the terms of this Agreement as if each of them had been a party hereto as an Author. The Author warrants that the use, reproduction, distribution, public or private performance or display, and/or modification of all or any portion of the Materials does not and will not violate, infringe and/or misappropriate the patent, trademark, intellectual property or other rights of any third party. The Author represents and warrants that it has and will continue to comply with all government, institutional and other regulations, including, without limitation all institutional, laboratory, hospital, ethical, human and animal treatment, privacy, and all other rules, regulations, laws, procedures or guidelines, applicable to the Materials, and that all research involving human and animal subjects has been approved by the Author's relevant institutional review board.

11. **JoVE Discretion.** If the Author requests the assistance of JoVE in producing the Video in the Author's facility, the Author shall ensure that the presence of JoVE employees, agents or independent contractors is in accordance with the relevant regulations of the Author's institution. If more than one author is listed at the beginning of this Agreement, JoVE may, in its sole

## ARTICLE AND VIDEO LICENSE AGREEMENT

discretion, elect not take any action with respect to the Article until such time as it has received complete, executed Article and Video License Agreements from each such author. JoVE reserves the right, in its absolute and sole discretion and without giving any reason therefore, to accept or decline any work submitted to JoVE. JoVE and its employees, agents and independent contractors shall have full, unfettered access to the facilities of the Author or of the Author's institution as necessary to make the Video, whether actually published or not. JoVE has sole discretion as to the method of making and publishing the Materials, including, without limitation, to all decisions regarding editing, lighting, filming, timing of publication, if any, length, quality, content and the like.

12. **Indemnification.** The Author agrees to indemnify JoVE and/or its successors and assigns from and against any and all claims, costs, and expenses, including attorney's fees, arising out of any breach of any warranty or other representations contained herein. The Author further agrees to indemnify and hold harmless JoVE from and against any and all claims, costs, and expenses, including attorney's fees, resulting from the breach by the Author of any representation or warranty contained herein or from allegations or instances of violation of intellectual property rights, damage to the Author's or the Author's institution's facilities, fraud, libel, defamation, research, equipment, experiments, property damage, personal injury, violations of institutional, laboratory, hospital, ethical, human and animal treatment, privacy or other rules, regulations, laws, procedures or guidelines, liabilities and other losses or damages related in any way to the submission of work to JoVE, making of videos by JoVE, or publication in JoVE or elsewhere by JoVE. The Author shall be responsible for, and shall hold JoVE harmless from, damages caused by lack of sterilization, lack of cleanliness or by contamination due to

the making of a video by JoVE its employees, agents or independent contractors. All sterilization, cleanliness or decontamination procedures shall be solely the responsibility of the Author and shall be undertaken at the Author's expense. All indemnifications provided herein shall include JoVE's attorney's fees and costs related to said losses or damages. Such indemnification and holding harmless shall include such losses or damages incurred by, or in connection with, acts or omissions of JoVE, its employees, agents or independent contractors.

13. **Fees.** To cover the cost incurred for publication, JoVE must receive payment before production and publication of the Materials. Payment is due in 21 days of invoice. Should the Materials not be published due to an editorial or production decision, these funds will be returned to the Author. Withdrawal by the Author of any submitted Materials after final peer review approval will result in a US\$1,200 fee to cover pre-production expenses incurred by JoVE. If payment is not received by the completion of filming, production and publication of the Materials will be suspended until payment is received.

14. **Transfer, Governing Law.** This Agreement may be assigned by JoVE and shall inure to the benefits of any of JoVE's successors and assignees. This Agreement shall be governed and construed by the internal laws of the Commonwealth of Massachusetts without giving effect to any conflict of law provision thereunder. This Agreement may be executed in counterparts, each of which shall be deemed an original, but all of which together shall be deemed to be one and the same agreement. A signed copy of this Agreement delivered by facsimile, e-mail or other means of electronic transmission shall be deemed to have the same legal effect as delivery of an original signed copy of this Agreement.

A signed copy of this document must be sent with all new submissions. Only one Agreement is required per submission.

### CORRESPONDING AUTHOR

Name:

Haley L. Zubyk

Department:

Biochemistry and Biomedical Sciences

Institution:

McMaster University

Title:

Ph.D. Candidate

Signature:

*Haley Zubyk*

Date:

July 4, 2019

Please submit a **signed** and **dated** copy of this license by one of the following three methods:

1. Upload an electronic version on the JoVE submission site
2. Fax the document to +1.866.381.2236
3. Mail the document to JoVE / Attn: JoVE Editorial / 1 Alewife Center #200 / Cambridge, MA 02140

**Editorial comments:**

1. Please take this opportunity to thoroughly proofread the manuscript to ensure that there are no spelling or grammar issues. The JoVE editor will not copy-edit your manuscript and any errors in the submitted revision may be present in the published version.

The appropriate edits have been made.

2. Please obtain explicit copyright permission to reuse any figures from a previous publication. Explicit permission can be expressed in the form of a letter from the editor or a link to the editorial policy that allows re-prints. Please upload this information as a .doc or .docx file to your Editorial Manager account. The Figure must be cited appropriately in the Figure Legend, i.e. "This figure has been modified from [citation]."

The appropriate edits have been made and copyright permission has been obtained.

3. JoVE cannot publish manuscripts containing commercial language. This includes trademark symbols (™), registered symbols (®), and company names before an instrument or reagent. Please remove all commercial language from your manuscript and use generic terms instead. All commercial products should be sufficiently referenced in the Table of Materials. You may use the generic term followed by "(Table of Materials)" to draw the readers' attention to specific commercial names. Examples of commercial sounding language in your manuscript are: Omni Trays, Millipore-Sigma, Thermo Fisher Scientific,

The appropriate edits have been made.

4. Please revise the Protocol text to avoid the use of personal pronouns (e.g., I, you, your, we, our) or colloquial phrases.

The appropriate edits have been made.

5. Please revise the Protocol to contain only action items that direct the reader to do something (e.g., "Do this," "Ensure that," etc.). The actions should be described in the imperative tense in complete sentences wherever possible. Avoid usage of phrases such as "could be," "should be," and "would be" throughout the Protocol. Any text that cannot be written in the imperative tense may be added as a "NOTE." Please include all safety procedures and use of hoods, etc. However, notes should be used sparingly and actions should be described in the imperative tense wherever possible. Please move the discussion about the protocol to the Discussion.

The appropriate edits have been made. NOTE is used for minor explanations for why a step is being performed and what is important to keep in consideration.

6. Please remove the embedded table from the manuscript and upload it separately to your Editorial Manager account in the form of an .xls or .xlsx file. Reference the table in the relevant step. Each table must be accompanied by a title and a description after the Representative Results of the manuscript text.

The appropriate edits have been made.

7. The Protocol should be made up almost entirely of discrete steps without large paragraphs of text between sections. Please simplify the Protocol so that individual steps contain only 2-3 actions per step and a maximum of 4 sentences per step. Use sub-steps as necessary.

The appropriate edits have been made. Paragraphs within the protocol have now been turned into sub-steps.

8. References: Please do not abbreviate journal titles; use full journal name.

The appropriate edits have been made.

9. Figure 1: Please replace "Omni Tray" with a generic term.

The appropriate edits have been made.

10. Table of Materials: Please remove any ™/®/© symbols. Please sort the materials alphabetically by material name.

The appropriate edits have been made.

**Reviewers' comments:****Reviewer #1:**

Manuscript Summary:

The manuscript entitled "Antibiotic dereplication using the Antibiotic Resistance Platform" discusses a very interesting a current topic, as MDR pathogens are a serious concern for clinicians worldwide. The paper is extremely well-written and methodologically sound, and will be interesting to anyone working in the field on antimicrobial drug design and discovery. I have the following remarks:

Overall, the paper is extremely well-written (both from an organisational and language perspective), only minor changes are needed (which will be detailed below). The M&M section is impeccably written and the results are

presented/discussed in a similar fashion.

My main concern is the introduction of the paper, which may hinder the manuscript from reaching a very wide readership.

Thank you very much for your feedback. Regarding your concerns for the introduction restricting the readership of this article, we have added additional discussion on the need for new antibiotics and specific pathogens that we hope will add additional information to orient the non-expert reader.

Minor Concerns:

The authors should discuss the current problem pathogens in a few sentences (namely the ESKAPE pathogens, i.e. MRSA, VRE, ESBL- and carbapenemase-producers etc.), with the inclusion of the following references:

Molecules 2019, 24(5), 892; <https://doi.org/10.3390/molecules24050892>

MRSA: Antibiotics 2019, 8(2), 52; <https://doi.org/10.3390/antibiotics8020052>

Clin Infect Dis. 2009 Jan 1;48(1):1-12. doi: 10.1086/595011.

The appropriate edits have been made.

**Reviewer #2:**

Manuscript Summary:

This manuscript describes an E coli platform that has about 100 antibiotic resistance genes cloned into individual strains. These allow for rapid screening for new antibiotics with dereplication (identification of previously known antibiotics)

Major Concerns:

None - the manuscript is well-prepared, useful, easy to read and merits publication

Minor Concerns:

None

Thank you very much for your feedback.

### INTRODUCTION

1. The publisher for this copyrighted material is Elsevier. By clicking "accept" in connection with completing this licensing transaction, you agree that the following terms and conditions apply to this transaction (along with the Billing and Payment terms and conditions established by Copyright Clearance Center, Inc. ("CCC"), at the time that you opened your Rightslink account and that are available at any time at <http://myaccount.copyright.com>).

### GENERAL TERMS

2. Elsevier hereby grants you permission to reproduce the aforementioned material subject to the terms and conditions indicated.

3. Acknowledgement: If any part of the material to be used (for example, figures) has appeared in our publication with credit or acknowledgement to another source, permission must also be sought from that source. If such permission is not obtained then that material may not be included in your publication/copies. Suitable acknowledgement to the source must be made, either as a footnote or in a reference list at the end of your publication, as follows:

"Reprinted from Publication title, Vol /edition number, Author(s), Title of article / title of chapter, Pages No., Copyright (Year), with permission from Elsevier [OR APPLICABLE SOCIETY COPYRIGHT OWNER]." Also Lancet special credit - "Reprinted from The Lancet, Vol. number, Author(s), Title of article, Pages No., Copyright (Year), with permission from Elsevier."

4. Reproduction of this material is confined to the purpose and/or media for which permission is hereby given.

5. Altering/Modifying Material: Not Permitted. However figures and illustrations may be altered/adapted minimally to serve your work. Any other abbreviations, additions, deletions and/or any other alterations shall be made only with prior written authorization of Elsevier Ltd. (Please contact Elsevier at [permissions@elsevier.com](mailto:permissions@elsevier.com)). No modifications can be made to any Lancet figures/tables and they must be reproduced in full.

6. If the permission fee for the requested use of our material is waived in this instance, please be advised that your future requests for Elsevier materials may attract a fee.

7. Reservation of Rights: Publisher reserves all rights not specifically granted in the combination of (i) the license details provided by you and accepted in the course of this licensing transaction, (ii) these terms and conditions and (iii) CCC's Billing and Payment terms and conditions.

8. **License Contingent Upon Payment:** While you may exercise the rights licensed immediately upon issuance of the license at the end of the licensing process for the transaction, provided that you have disclosed complete and accurate details of your proposed use, no license is finally effective unless and until full payment is received from you (either by publisher or by CCC) as provided in CCC's Billing and Payment terms and conditions. If full payment is not received on a timely basis, then any license preliminarily granted shall be deemed automatically revoked and shall be void as if never granted. Further, in the event that you breach any of these terms and conditions or any of CCC's Billing and Payment terms and conditions, the license is automatically revoked and shall be void as if never granted. Use of materials as described in a revoked license, as well as any use of the materials beyond the scope of an unrevoked license, may constitute copyright infringement and publisher reserves the right to take any and all action to protect its copyright in the materials.

9. **Warranties:** Publisher makes no representations or warranties with respect to the licensed material.

10. **Indemnity:** You hereby indemnify and agree to hold harmless publisher and CCC, and their respective officers, directors, employees and agents, from and against any and all claims arising out of your use of the licensed material other than as specifically authorized pursuant to this license.

11. **No Transfer of License:** This license is personal to you and may not be sublicensed, assigned, or transferred by you to any other person without publisher's written permission.

12. **No Amendment Except in Writing:** This license may not be amended except in a writing signed by both parties (or, in the case of publisher, by CCC on publisher's behalf).

13. **Objection to Contrary Terms:** Publisher hereby objects to any terms contained in any purchase order, acknowledgment, check endorsement or other writing prepared by you, which terms are inconsistent with these terms and conditions or CCC's Billing and Payment terms and conditions. These terms and conditions, together with CCC's Billing and Payment terms and conditions (which are incorporated herein), comprise the entire agreement between you and publisher (and CCC) concerning this licensing transaction. In the event of any conflict between your obligations established by these terms and conditions and those established by CCC's Billing and Payment terms and conditions, these terms and conditions shall control.

14. **Revocation:** Elsevier or Copyright Clearance Center may deny the permissions described in this License at their sole discretion, for any reason or no reason, with a full refund payable to you. Notice of such denial will be made using the contact information provided by you. Failure to receive such notice will not alter or invalidate the denial. In no event will Elsevier or Copyright Clearance Center be responsible or liable for any costs, expenses or damage incurred by you as a result of a denial of your permission request, other than a refund of the amount(s) paid by you to Elsevier and/or Copyright Clearance Center for denied permissions.

### **LIMITED LICENSE**

The following terms and conditions apply only to specific license types:

15. **Translation:** This permission is granted for non-exclusive world **English** rights only unless your license was granted for translation rights. If you licensed translation rights you may only translate this content into the languages you requested. A professional translator must perform all translations and reproduce the content word for word preserving the integrity of the article.

16. **Posting licensed content on any Website:** The following terms and conditions apply as follows: Licensing material from an Elsevier journal: All content posted to the web site must maintain the copyright information line on the bottom of each image; A hyper-text must be included to the Homepage of the journal from which you are licensing at

<http://www.sciencedirect.com/science/journal/xxxxx> or the Elsevier homepage for books at <http://www.elsevier.com>; Central Storage: This license does not include permission for a

scanned version of the material to be stored in a central repository such as that provided by Heron/XanEdu.

Licensing material from an Elsevier book: A hyper-text link must be included to the Elsevier homepage at <http://www.elsevier.com>. All content posted to the web site must maintain the copyright information line on the bottom of each image.

**Posting licensed content on Electronic reserve:** In addition to the above the following clauses are applicable: The web site must be password-protected and made available only to bona fide students registered on a relevant course. This permission is granted for 1 year only. You may obtain a new license for future website posting.

**17. For journal authors:** the following clauses are applicable in addition to the above:

**Preprints:**

A preprint is an author's own write-up of research results and analysis, it has not been peer-reviewed, nor has it had any other value added to it by a publisher (such as formatting, copyright, technical enhancement etc.).

Authors can share their preprints anywhere at any time. Preprints should not be added to or enhanced in any way in order to appear more like, or to substitute for, the final versions of articles however authors can update their preprints on arXiv or RePEc with their Accepted Author Manuscript (see below).

If accepted for publication, we encourage authors to link from the preprint to their formal publication via its DOI. Millions of researchers have access to the formal publications on ScienceDirect, and so links will help users to find, access, cite and use the best available version. Please note that Cell Press, The Lancet and some society-owned have different preprint policies. Information on these policies is available on the journal homepage.

**Accepted Author Manuscripts:** An accepted author manuscript is the manuscript of an article that has been accepted for publication and which typically includes author-incorporated changes suggested during submission, peer review and editor-author communications.

Authors can share their accepted author manuscript:

- immediately
  - via their non-commercial person homepage or blog
  - by updating a preprint in arXiv or RePEc with the accepted manuscript
  - via their research institute or institutional repository for internal institutional uses or as part of an invitation-only research collaboration work-group
  - directly by providing copies to their students or to research collaborators for their personal use
  - for private scholarly sharing as part of an invitation-only work group on commercial sites with which Elsevier has an agreement
- After the embargo period
  - via non-commercial hosting platforms such as their institutional repository
  - via commercial sites with which Elsevier has an agreement

In all cases accepted manuscripts should:

- link to the formal publication via its DOI
- bear a CC-BY-NC-ND license - this is easy to do
- if aggregated with other manuscripts, for example in a repository or other site, be shared in alignment with our hosting policy not be added to or enhanced in any way to appear more like, or to substitute for, the published journal article.

**Published journal article (JPA):** A published journal article (PJA) is the definitive final record of published research that appears or will appear in the journal and embodies all

value-adding publishing activities including peer review co-ordination, copy-editing, formatting, (if relevant) pagination and online enrichment.

Policies for sharing publishing journal articles differ for subscription and gold open access articles:

**Subscription Articles:** If you are an author, please share a link to your article rather than the full-text. Millions of researchers have access to the formal publications on ScienceDirect, and so links will help your users to find, access, cite, and use the best available version. Theses and dissertations which contain embedded PJAs as part of the formal submission can be posted publicly by the awarding institution with DOI links back to the formal publications on ScienceDirect.

If you are affiliated with a library that subscribes to ScienceDirect you have additional private sharing rights for others' research accessed under that agreement. This includes use for classroom teaching and internal training at the institution (including use in course packs and courseware programs), and inclusion of the article for grant funding purposes.

**Gold Open Access Articles:** May be shared according to the author-selected end-user license and should contain a [CrossMark logo](#), the end user license, and a DOI link to the formal publication on ScienceDirect.

Please refer to Elsevier's [posting policy](#) for further information.

**18. For book authors** the following clauses are applicable in addition to the above:

Authors are permitted to place a brief summary of their work online only. You are not allowed to download and post the published electronic version of your chapter, nor may you scan the printed edition to create an electronic version. **Posting to a repository:** Authors are permitted to post a summary of their chapter only in their institution's repository.

**19. Thesis/Dissertation:** If your license is for use in a thesis/dissertation your thesis may be submitted to your institution in either print or electronic form. Should your thesis be published commercially, please reapply for permission. These requirements include permission for the Library and Archives of Canada to supply single copies, on demand, of the complete thesis and include permission for Proquest/UMI to supply single copies, on demand, of the complete thesis. Should your thesis be published commercially, please reapply for permission. Theses and dissertations which contain embedded PJAs as part of the formal submission can be posted publicly by the awarding institution with DOI links back to the formal publications on ScienceDirect.

### **Elsevier Open Access Terms and Conditions**

You can publish open access with Elsevier in hundreds of open access journals or in nearly 2000 established subscription journals that support open access publishing. Permitted third party re-use of these open access articles is defined by the author's choice of Creative Commons user license. See our [open access license policy](#) for more information.

#### **Terms & Conditions applicable to all Open Access articles published with Elsevier:**

Any reuse of the article must not represent the author as endorsing the adaptation of the article nor should the article be modified in such a way as to damage the author's honour or reputation. If any changes have been made, such changes must be clearly indicated.

The author(s) must be appropriately credited and we ask that you include the end user license and a DOI link to the formal publication on ScienceDirect.

If any part of the material to be used (for example, figures) has appeared in our publication with credit or acknowledgement to another source it is the responsibility of the user to ensure their reuse complies with the terms and conditions determined by the rights holder.

#### **Additional Terms & Conditions applicable to each Creative Commons user license:**

**CC BY:** The CC-BY license allows users to copy, to create extracts, abstracts and new works from the Article, to alter and revise the Article and to make commercial use of the Article (including reuse and/or resale of the Article by commercial entities), provided the user gives appropriate credit (with a link to the formal publication through the relevant DOI), provides a link to the license, indicates if changes were made and the licensor is not

represented as endorsing the use made of the work. The full details of the license are available at <http://creativecommons.org/licenses/by/4.0>.

**CC BY NC SA:** The CC BY-NC-SA license allows users to copy, to create extracts, abstracts and new works from the Article, to alter and revise the Article, provided this is not done for commercial purposes, and that the user gives appropriate credit (with a link to the formal publication through the relevant DOI), provides a link to the license, indicates if changes were made and the licensor is not represented as endorsing the use made of the work. Further, any new works must be made available on the same conditions. The full details of the license are available at <http://creativecommons.org/licenses/by-nc-sa/4.0>.

**CC BY NC ND:** The CC BY-NC-ND license allows users to copy and distribute the Article, provided this is not done for commercial purposes and further does not permit distribution of the Article if it is changed or edited in any way, and provided the user gives appropriate credit (with a link to the formal publication through the relevant DOI), provides a link to the license, and that the licensor is not represented as endorsing the use made of the work. The full details of the license are available at <http://creativecommons.org/licenses/by-nc-nd/4.0>.

Any commercial reuse of Open Access articles published with a CC BY NC SA or CC BY NC ND license requires permission from Elsevier and will be subject to a fee.

Commercial reuse includes:

- Associating advertising with the full text of the Article
- Charging fees for document delivery or access
- Article aggregation
- Systematic distribution via e-mail lists or share buttons

Posting or linking by commercial companies for use by customers of those companies.

## 20. Other Conditions:

v1.9

**You will be invoiced within 48 hours of this transaction date. You may pay your invoice by credit card upon receipt of the invoice for this transaction. Please follow instructions provided at that time.**

**To pay for this transaction now; please remit a copy of this document along with your payment. Payment should be in the form of a check or money order referencing your account number and this invoice number RLNK503213211.**

**Make payments to "COPYRIGHT CLEARANCE CENTER" and send to:**

**Copyright Clearance Center  
29118 Network Place  
Chicago, IL 60673-1291**

**Please disregard electronic and mailed copies if you remit payment in advance**

**Questions? [customercare@copyright.com](mailto:customercare@copyright.com) or +1-855-239-3415 (toll free in the US) or +1-978-646-2777.**
