

Figure 1

A

B

Traditional cloning strategy

- 1) Clone *CDR1* into *PacI/NotI* of pABC3-XLmGFPHis
- 2) *Ascl* digest pABC3-*CDR1*-mGFPHis
- 3) Purify the *CDR1* transformation cassette
- 4) Transform *ADΔΔ* with the transformation cassette

XLmGFPHis double tag (i.e. mGFPHis).

X:	HRV-3C protease cleavage site (LEVLFQ GP)
L:	linker (GGSGG)
mGFP:	monomeric yEGFP3 (A206K)
His:	6xHis-tag (GGSHHHHHH)

C

One-step cloning strategy

- 1) PCR amplify ORF + right + left arm DNA fragments and transform *ADΔΔ*

D

Whole cell assays of cells overexpressing efflux pump

- ➔ Quantification of efflux pump activities with fluorescent substrates (R6G, Nile red).
- ➔ Quantification of i) increased resistance to efflux pump substrates [i.e. minimum growth inhibitory concentrations (MICs)] or ii) inhibitor sensitivities of drug efflux (2-dimensional checkboard assays).
- ➔ High-throughput screening for novel efflux pump inhibitors.
- ➔ Agar disk diffusion assays to determine the substrate specificity or the inhibitor sensitivity of multidrug efflux pumps.
